ABSTRACT

Certain embodiments include carbonate esters of rapamycin at position 42 that are synthesized by a lipase catalyzed regio-specific process. These compounds or a pharmaceutically acceptable salt thereof are useful in the treatment of organ and tissue transplant rejection, autoimmune disease, proliferative disorder, restenosis, cancer, or microbial infection.
RAPAMYCIN CARBONATE ESTERS

FIELD OF THE INVENTION

[0001] The inventions are, in general, related to the field of pharmaceuticals, and certain embodiments relate to synthesis and treatment of diseases using the same.

BACKGROUND

[0002] Rapamycin is a macrolide antibiotic ("mycin") first discovered as a product of the bacterium Streptomyces kyroscopius in a soil sample from an island called Rapa Nui, better known as Easter Island. It was originally developed as an antifungal agent. However, it was soon discovered that rapamycin had potent immunosuppressive and antiproliferative properties. Rapamycin was then developed into a relatively new immunosuppressant drug used to prevent rejection in organ transplantation, and is especially useful in kidney transplants. It is marketed under the trade name RAPAMUNE by Wyeth.

[0003] Despite its similar name, rapamycin is not a calcineurin inhibiter like tacrolimus or cyclosporin. However, it has a similar suppressive effect on the immune system. Rapamycin inhibits the response to interleukin-2 (IL-2) and thereby blocks activation of T- and B-cells. In contrast, tacrolimus and ciclosporine inhibit the production of IL-2.

[0004] The mode of action of rapamycin is to bind the cytosolic protein FK-binding protein 12 (FKBP12) in a manner similar to tacrolimus. However, unlike the tacrolimus-FKBP12 complex which inhibits calcineurin (PP2B), the rapamycin-FKBP12 complex inhibits the mammalian target of rapamycin (mTOR) pathway through direct binding to the mTOR Complex1 (mTORC1). mTOR is also called FRAP (FKBP12-rapamycin associated protein) or RAFT (rapamycin and FKBP target). FRAP and RAFT are in fact more accurate names since they reflect the fact that rapamycin must bind FKBP12 first, and only the FKBP12-rapamycin complex can bind FRAP/RAFT/mTOR.

[0005] The chief advantage rapamycin has over calcineurin inhibitors is that it is not toxic to kidneys. Transplant patients maintained on calcineurin inhibitors long-term tend to develop impaired kidney function or even chronic renal failure, and this can be prevented by the use of rapamycin instead. It is particularly advantageous in patients with kidney transplants for hemolytic-uremic syndrome as this disease is likely to recur in the transplanted kidney if a calcineurin-inhibitor is used.

[0006] Rapamycin can also be used alone or in conjunction with calcineurin inhibitors and/or mycophenolate mofetil, to provide steroid-free immunosuppression regimes. As impaired wound healing is a possible side effect of rapamycin, some transplant centers prefer not to use it immediately after the transplant operation, and start to give it after a period of weeks or months. Its optimal role in immunosuppression has not yet been determined and is the subject of a number of ongoing clinical trials.

SUMMARY OF THE INVENTION

[0007] Compounds comprising the following structure (I), (II), or (III) can be synthesized using lipase as the catalyzing reagent.

In structures I, II and III,

[0008] R^a is \(-\text{C(=O)}\text{OR}^2, \text{C(=S)}\text{OR}^3, \text{C(=O)}\text{SR}^3, \text{C(=S)}\text{SR}^3\), and.

[0009] R^2 is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, or Ar—(CH_2)_n—
where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, where at least one hydrogen of R² is replaced by a hydroxyl group, an amino group, a thio group, a phosphate group, a carbonyl group, a sulfonate group, a sulfonamide group, a sulfamido group, a carbamate group or a combination thereof.

R³ is \(-\overline{\mathrm{C}}(-\overline{\mathrm{O}})\overline{\mathrm{R}}\)², \(-\overline{\mathrm{C}}(-\overline{\mathrm{S}})\overline{\mathrm{R}}\)², \(-\overline{\mathrm{C}}(-\overline{\mathrm{O}})\overline{\mathrm{SR}}\)², or \(-\overline{\mathrm{C}}(-\overline{\mathrm{S}})\overline{\mathrm{SR}}\)² and,

R⁴ is \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) alkyl, \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) alkenyl, \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) alkynyl, \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) cycloalkyl, \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) heteroalkyl, \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) heteroaryl, or an aromatic group.

R⁵ and R⁶ are each independently \(-\overline{\mathrm{C}}(-\overline{\mathrm{O}})\overline{\mathrm{O}}\)⁰, \(-\overline{\mathrm{C}}\overline{\mathrm{S}}\)⁰, \(-\overline{\mathrm{C}}(-\overline{\mathrm{O}})\overline{\mathrm{S}}\), or \(-\overline{\mathrm{C}}\overline{\mathrm{S}}\).

A is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroaryl, \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) heteroalkyl, \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) heteroaryl, or \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) heterocycl, and \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) Ar where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl.

B is rapamycin or derivative thereof, alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroaryl, heterocyclic, and \(\overline{\mathrm{C}}_2\overline{\mathrm{C}}_2\) Ar where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl.

Chemical formula: \(\overline{\mathrm{C}}_2\overline{\mathrm{F}}_10\overline{\mathrm{N}}\overline{\mathrm{O}}_{13}\)

Rapamycin is a molecule comprising a 31-membered ring including a pipercyclin group and pyranose ring, a conjugated triene system and a tri-carboxylic acid region. It also has 15 chiral centers, such that the number of possible stereoisomers is very large. Synthesis involving rapamycin therefore presents many challenges to synthetic chemists.

The secondary hydroxyls of rapamycin at positions 31 and 42 respectively are the subject of modifications of appropriate synthetic methodologies. Carbonate esters of rapamycin at position 42 in particular have been shown to have immunosuppressant properties and are useful in the treatment of transplant rejection and autoimmune diseases (U.S. Pat. No. 5,260,300, which discloses certain carbonate esters). Some modifications at the 42 position show equal or increased potency compared to rapamycin. For example, certain carbonate derivatives at 42 position have demonstrated IC₅₀ equal to or greater than rapamycin in lymphocyte proliferation (LAF) assay.

A number of patents disclose the preparation methods of certain 42-derivatives of rapamycin such as certain alkyl esters (U.S. Pat. No. 4,316,885), certain amino alkyl esters (U.S. Pat. No. 4,650,803), certain fluorinated esters (U.S. Pat. No. 5,100,883), certain amide esters (U.S. Pat. No. 5,118,677), certain carbamate esters (U.S. Pat. No. 5,118,678), certain alkoxy esters (U.S. Pat. No. 5,223,036), certain carbonate esters (U.S. Pat. No. 5,260,300), certain hydroxyster (U.S. Pat. Nos. 5,362,718 & 6,277,983), and certain rapamycin dimmers afforded through ester linkages (U.S. Pat. No. 5,120,727). However, these preparation methods typically afford poor to moderate yields as a result of poor regio-selectivity and the instability of rapamycin in basic or acidic conditions.
[0023] Improvements of the preparation methods have been made. For example, improvement of regio-selectivity through the employment of 31-silyl protected rapamycin was reported (U.S. Pat. No. 6,277,983), which introduced several extra synthetic steps. Additionally, a preparation method through the use of microbial lipases for the catalytic acylation of rapamycin to afford 42-ester derivatives was reported (U.S. Pat. 2005/0234234A1), which made use of acyl donors to afford esters.

[0024] Structures I, II and III are carbonate esters of rapamycin, which have been prepared via regio-selective lipase mediated synthesis shown in Scheme I. Carbonate donors were used for the generation of regio-specific carbonate esters to react specifically at the '42 position of rapamycin. For example, mono-hydroxy carbonate esters, polyhydroxy carbonate esters, di-carbonate esters, and carbonate dimers were used as donors to make carbonate esters of rapamycin. The methods disclosed herein are effective at using lipase to add carbonate functionality regio-specifically at 42-position of rapamycin or derivative thereof. The process disclosed herein illustrates improved yields and regio-specificity, for instance, as in comparison with the process disclosed in U.S. Pat. No. 5,260,300.

[0025] Donors

[0026] In one embodiment, the donor is diethyl carbonate, dioctyl carbonate, ethyl octyl carbonate, diallyl carbonate, cis-octadec-9-etyl vinyl carbonate, divinyl carbonate, 1,4-bis(vinylcarbonate)butane, 1,3-dioxane-2-one, 3-(trimethylsilyloxy)propyl vinyl carbonate, 3-(tert-butyldimethylsilyloxy)propyl vinyl carbonate, (S)-2,2-dimethyl-1,3-dioxolane-4-methyl vinyl carbonate and (S)-2,2-dimethyl-1,3-dioxolane-4-methyl vinyl carbonate.

[0027] In another embodiment, the donor is bifunctional. The bifunctional donor is 1,4-bis(vinylcarbonate)butane, 1,3-bis(vinylcarbonate)propane, 1,2-bis(vinylcarbonate)ethane, 1,4-bis(ethylcarbonate)butane, 1,3-bis(ethylcarbonate)propane, 1,2-bis(ethylcarbonate)ethane, 1,4-bis(methyl vinyl carbonate)cyclohexane or 2,5-bis(methyl vinyl carbonate)fur.

[0028] In one embodiment, the donor is symmetric, asymmetric or cyclic carbonates including alkyl carbonates, dialkyl carbonates, vinyl carbonates, divinyl carbonates, alkyl vinyl carbonates, and cyclic carbonates.

[0029] The synthesis discussed in the examples focuses on using carbonate donors. The synthesis involved when other donors such as thiocarbonate, dithiocarbonate are used is known in the art to be similar to the synthesis of carbonate derivatives. This similar synthesis can be adapted by a person of ordinary skill in the art to make other derivatives of rapamycin.

[0030] In one embodiment, the donor is a carbonate, O,O'-thiocarbonate, O,S-thiocarbonate, O,S-dithiocarbonate, or S,S'-dithiocarbonate donor of a general structure (IV),

\[
\text{(IV)}
\]

[0031] wherein:

[0032] \( R' \) is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, and \( \text{Ar} = \text{(CH}_2\text{)}_n \text{Ar} \), where \( n \) is 0 to 12 and \( \text{Ar} \) is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, where at least one hydrogen of \( R' \) is replaced by a hydroxyl group, an amino group, a thio group, a phosphate group, a carbonyl group, a sulfonyl group, a sulfonamide group, a sulfamidine group, a carbonate group or a combination thereof.

[0033] the hydroxyl group, the amino group, the thio group, the phosphate group, the carbonyl group, the sulfonyl group, the sulfonamide group, the sulfamidine group, or the carbonate group is protected by a protection group, and

[0034] \( R'' \) is a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or alkyl group.

[0035] wherein the protection group is removed from the hydroxyl group, the amino group, the thio group, the phosphate group, the carbonyl group, the sulfonyl group, the sulfonamide group, the sulfamidine group, the carbonate group
or a combination thereof after the regio-selective lipase mediated synthesis to make a derivative of rapamycin comprising structure (I).

In one embodiment, the one hydrogen of R' is replaced by a hydroxyl group. In one embodiment, the R' is a vinyl group.

In one embodiment, the donor is a carbonate, O,O'-thiocarbonate, O,S-thiocarbonate, O,S-dithiocarbonate, or S,S'-dithiocarbonate donor of a general structure (V)."

\[
\begin{align*}
R^2 & \quad O \quad R^2 \\
R^2 & \quad S \quad R^2
\end{align*}
\]

wherein:

R' is C6-C18 alkyl, C7-C22 alkenyl, C7-C22 alkynyl, C6-C18 cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocycloalkyl,

wherein the aromatic group is Ar—(CH2)n— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, naphthyl, biphenyl, anthryl, tetrahydroxynaphthyl, phenanthryl, indane, tetracenyl, pentacenyl, triphenylmethyl, triazole, tetrazole, oxazoly, isoxazoly, thiazoly, isothiazoly, thiofuranyl, pyrimidinyl, pyrazinyl, thiadiazinyl, phenyl substituted with amine, phosphoryl, phosphinate, sulfonyl, sulfonate, sulfonamide, and

R' is a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or allyl group.

The donor of general structure (V) is used in the regio-selective lipase mediated synthesis to make a derivative of rapamycin comprising structure (II). In one embodiment, R' is a vinyl group.

In one embodiment, the donor is a bifunctional donor of a general structure (VI)."

\[
\begin{align*}
R^2 & \quad O \quad R^2 \\
R^2 & \quad S \quad R^2
\end{align*}
\]

wherein:

R' and R'' are each independently —C(=O)O—, —C(=O)S—, or —C(=S)S—.

A is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocycloalkyl, and —(CH2)n— Ar—(CH2)n— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, and

R' and R'' are each independently a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or allyl group.

The donor of general structure (VI) is used in the regio-selective lipase mediated synthesis to make a derivative of rapamycin, which is further reacted with a compound of formula B—OH, where OH is a hydroxyl group and B is rapamycin or derivative thereof, alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocycloalkyl, and Ar—(CH2)n— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, to make a rapamycin derivative comprising structure (III). In one embodiment, the hydroxyl group in formula B—OH is the 42-hydroxyl of rapamycin or derivative thereof. In one embodiment, the B—OH is alkyl alcohols, alkenyl alcohols, alkynyl alcohols, aryalkyl alcohols, diols, triols, polyols, cyclic alcohols, and polyethers. In one embodiment, R' and R'' are each independently a vinyl group.

Chemical name is generally used to describe a substituent, for example alkyl, aryl, etc. Occasionally, the term group is added to the chemical name to describe a substituent, for example carbonyl group, thio carbonyl group, etc. It is understood that both type of descriptions are valid and can be used interchangeably throughout the specification. The term heterocyclic is used herein, meaning a cyclic compound having as a ring member at least two different elements. Cyclic compounds may be aromatic or non-aromatic with at least one ring, e.g., one, two, three, or more rings.

An aromatic group can be any conjugated ring system containing 4n+2 π electrons. There are many criteria available for determining aromaticity. A widely employed criterion for the quantitative assessment of aromaticity is the resonance energy. In some embodiments, the resonance energy of the aromatic group is at least 10 KJ/mol. In further embodiments, the resonance energy of the aromatic group is greater than 0 KJ/mol.

Aromatic groups may be classified as an aromatic heterocyclic group which contains at least one heteroatom in the 4n+2 π-electron ring, or as an arene or aryl group which does not contain a heteroatom in the 4n+2 π-electron ring. Nonetheless, either the aromatic heterocyclic or the arene or aryl group may have at least one heteroatom in a substituent attached to the 4n+2 π-electron ring. Furthermore, either the aromatic heterocyclic or the arene or aryl group may comprise a monocyclic or polycyclic (such as bicyclic, tricyclic, etc.) aromatic ring. An arene is a monocyclic or polycyclic aromatic hydrocarbon; an aryl is formed by removal of a hydrocarbon from a ring carbon atom of an arene.

Non-limiting examples of the aromatic heterocyclic group are furan, thiophen, pyrrole, indolyl, carbazolyl, benzo[1,5]naphtho[2,6-c]phenanthridinyl, dibenzofuran, dibenzo[2,3]thiophenyl, pyridinyl, pyridazinyl, pyrimidinyl, pyrazinyl, triazinyl, benzothienyl, benzazinyl, quinolinyl, isoquinolinyl, cinchoninyl, phthalazinyl, quinazolinyl, quinoxalinyl, naphthyridinyl, pyridinyl, acridinyl, phenanthridinyl, phenanthrolinyl, anthryridinyl, purinyl, pteridinyl, alloxazinyl, phenazinyl, phenoazainyl, phenoazathinyl, dibenzo-1,4-dioxinyl, thianthrenyl, and a combination thereof. The aromatic heterocyclic group may also include any combination of the above aromatic heterocyclic groups bonded together either by a bond (as in carbazolyl) or by a linking group (as in di-10,10-phenothiazinyl). The linking group may include an aliphatic group, an aromatic group, a heterocyclic group, or a combination thereof. Furthermore, either an aliphatic group or an aromatic group within a linking group may comprise at least one heteroatom such as O, S, and N. Non-limiting examples of the aryl group are arenapthalinyl, biphenyl, anthryl, tetrahydroxynaphthyl, phenanthryl, indane, tetracenyl, pentacenyl, triphenylmethyl, indazolyl, triazolyl, tetrazolyl, oxazolyl, isoxazolyl, thiazolyl, isothiazolyl, thiofuranyl, pyrimidinyl, pyrazinyl, thiazolyl, phenyl substituted with amine, phosphoryl, phosphate, sulfonyl, sulfonate, or sulfonamide and aromatic heterocyclic group. The aryl group may also include any combination of the above aryl groups bonded together either by a bond (as in biphenyl) or by a linking group (as in stilbene, diphenyl sulfone, an arylamine group). The linking group may include an aliphatic group, an aromatic group, a heterocyclic group, or a combination thereof. Furthermore, either an aliphatic group or an aromatic group within a linking group may comprise at least
one heteroatom such as O, S, and N. The term arylamine
group includes an N,N-disubstituted arylamine group (e.g.,
diphenylamine, ethylenediamine, and diethylamine group), a
juulidinyl group, and a carbazolyl group.

[0053] An cyclic compound is a cyclic aliphatic compo-
ound having at least one ring, e.g., one, two, three, or more
rings. The term aliphatic compound refers to an organic com-
 pound that is an alkane or alkenes or alkyne or their derivative.
Examples of aliphatic compounds include cycloalkanes, e.g.,
cyclohexane, 1-cyclopentane, 1-cyclooctane, 1-cyclooctane,
and bicyclo[2.2.1]heptane group. A heterocyclic non-aromatic
compound is a compound having at least one ring and at least
two different elements in the ring, e.g., an N, O, or S substi-
tuted into at least one ring carbon of cyclohexane, cyclo-
ctane, or bicyclo[2.2.1]heptane group.

[0054] The term alkyl, unless otherwise specified, refers to
a saturated straight, branched, or cyclic hydrocarbon, and
specifically includes, e.g., methyl, ethyl, propyl, isopropyl,
butyl, isobutyl, t-butyl, pentyl, cyclopentyl, isopentyl, neo-
pentyl, hexyl, isohexyl, cyclohexas, 3-methylpentyl, 2,2-
dimethylbutyl, and 2,3-dimethylbutyl. The alkyl group can be
optionally substituted with any appropriate group, including
but not limited to one or more groups selected from halo,
hydroxy, amino, arylamino, alkoxy, aryloxy, nitro, cyano,
sulfonic acid, sulfite, phosphonic acid, phos-
phate, or phosphate, either unprotected, or protected as
necessary, as known to those skilled in the art. The term
alkenyl, unless otherwise specified, is a straight, branched,
or cyclic (in the case of C₅₋₆) hydrocarbon with at least one
double bond, and may be substituted as described above.
The term alkynyl, unless otherwise specified, is a hydrocarbon,
straight or branched, with at least one triple bond, and may
be substituted as described above. In some embodiments, it is
useful to limit the size of these substituents to, e.g., less than
about 150, less than about 100, less than about 50, or less than
about 20 atoms.

[0055] Substitution is liberally allowed on the chemical
rings, and on the atoms that occupy a position in a formula
depicted herein, for various physical effects on the properties
of the compounds, such as mobility, sensitivity, solubility,
compatibility, stability, and the like, as is known generally in
the art. In the description of chemical substituents, there
are certain practices common to the art that are reflected in the
use of language. The term group indicates that the generally
recited chemical entity (e.g., alkyl group, alkenyl group, ar-
omatic group, epoxy group, arylamine group, aromatic het-
erocyclic group, aryl group, aliphatic group, heterocyclic
substitution is allowed which is consistent with the bond
structure of that group. For example, where the term ‘alkyl’
group is used, that term would not only include unsubstituted
linear, branched and cyclic alkyls, such as methyl, ethyl, iso-
propyl, tert-butyl, cyclohexyl, dodecyl and the like, but also substituents having
heteroatom such as 3-ethoxypropyl, 4- (N-ethylamino)butyl,
3-hydroxypropyl, 2-thiohexyl, 1,2,3-tribrompropyl, and the like.
However, as is consistent with such nomenclature, no substitut-
ent would be included within the term that would alter the
fundamental bond structure of the underlying group.
For example, where a phenyl group is recited, substitution
such as 1-aminophenyl, 2,4-dihydroxyphenyl, 1,3,5-
trithiophenyl, 1,3,5-trimethoxyphenyl and the like would be
acceptable within the terminology, while substitution of 1,1,
2,2,3,3-hexamethyphenyl would not be acceptable as that
substitution would require the ring bond structure of the phen-
yl group to be altered to a non-aromatic form because of the
substitution. When referring to an epoxy group, the substitu-
cent cited includes any substitution that does not destroy the
3-membered ring structure of the epoxy group.

[0056] All of these various groups may be optionally deriv-
itized with substituent groups. Suitable substituent groups
that may be present on such a “substituted” group include e.g.
halogens such as fluoro, chloro, bromo and iodo; cyano; H,
hydroxy group; ester group; ether group; a carbamate, an oxo
acid group, an oxo carbon group, an oxo carboxylic acid
group, an oxo group, a ketene group; nitro; azido; sulphhydryl;
alkanoyl e.g. CO₂H, alkanoyl group such as acetyl and the like;
carboxamide; alkyl groups, alkenyl and alkynyl groups
including groups having one or more unsaturated linkages;
halogen groups having one or more oxygen linkages; aryl-
aryl such as phenoxy; alkylthio groups; alkylsulfinyl groups;
aldehydehydryl groups; aminoalkyl groups such as groups hav-
ing one or more N atoms; carboxylic ary1; aryl groups such as phenoxy; aralkyl
having 1 to 3 separate or fused rings; aralkoxy having 1 to 3 separate or fused rings;
or a heterocyclic, heterocyclic or a heterocyclic group having 1 to 4
separate or fused rings e.g., with one or more N, O or S atoms,
e.g. coumarinyl, quinoloxyl, quinyl, pyridyl, pyrazinyl, pyrimidyl,
furyl, pyrrol, thienyl, thiadiazolyl, oxadiazolyl, imidazolyl,
indolyl, benzo furanyl, benzo thiazolyl, tetraldehyde, tetra-
hydrocarbonyl, piperidinyl, morpholinyl and pyridylidini.
Other substituents may include groups that include O, S, Se,
N, P, Si, C and have between 2 and about 150 atoms. In some
embodiments, it is useful to limit the size of any substituent
to, e.g., less than about 150, less than about 100, less than
about 50, or less than about 20 atoms.

[0057] Other suitable substituent groups include these and
other N-containing compounds e.g., amines, amides,
imidium ions, amine imides, amine oxides, ammonium ions,
ammonitriles, nitrenes, aminoxides, nitrides, and nitride imi-
des. Other suitable substituent groups include these other
O-containing compounds, e.g., sulfonic acid, sulfate,
sulfates, sulfamic acids, sulfines, sulfonamides, sulfines,
sulfenic acids, sulfonium ions, sulfenyl groups,
sulfenylium ions, sulfenyl nitrenes, sulfenyl radicals,
sulfides, sulfenimines, sulfonates, sulfonamides, sul-
finamides, sulfines, sulfinic acids, sulfinic anhydrides,
sulfonaminges, sulfonofluoranes, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sul-
finamides, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
sulfonamines, sulfonofluoranes, sulfonamines, sulfonic
acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,

acids, sulfonic anhydrides, sulfonamines, sulfonium
compounds, sulfonofluoranes, sulfonamines, sulfonofluoranes,
A variety of substituents are contemplated so that some potential combinations of claimed embodiments may be unstable or impractical to make. A person of ordinary skill in the art can select appropriate stable compounds within the disclosed genus of compounds based on the disclosure herein. Therefore, substituents generally are limited to those substituents that result in appropriate valence for the particular substituted element without forming a charged compound or a radical (except for titratable charged groups, stable zwitterionic forms and triplet neutral radicals with formal unpaired spins with full valencies), as can be conventionally determined by a person of ordinary skill in the art.

Lipase

Lipase is a water-soluble enzyme that catalyzes the hydrolysis of ester bonds. Lipases from fungi and bacteria sources are exploited for various synthetic purposes. For example, Lipase from Candida antarctica “B” Lipase (Novozyme 435) produced by submerged fermentation of a genetically modified Aspergillus oryzae microorganism and absorbed on a macroporous acrylic resin is used in the synthesis of esters and amides, and is known to have broad substrate specificity. A review published in *Chemical Review* (2001, 101, 2097-2124) by Richard A. Gross et al. reported lipase catalyzed polycarbonate synthesis.

The Applicants have found lipase can be used to catalyze the addition of carbonate functionality regio-specifically at 42-position of rapamycin or derivative thereof. In one embodiment, the lipase is Novozyme 435 (Sigma-Aldrich, St Louis, Mo.), which is immobilized on macroporous acrylic resin. In another embodiment, the lipase is Amano Lipase PS-C II (Sigma-Aldrich, St Louis, Mo.), which is immobilized on ceramic. In a further embodiment, the lipase is Aspergillus niger lipase, Candida antarctica “A” lipase, Candida antarctica “B” lipase, Amano Lipase PS-C II, Candida rugosa lipase, Muscor miehei lipase, Pseudomonas cepacia lipase (lipase PS), Rhizopus delemar lipase, or alake.

The immobilization of the enzyme on solid support provides added advantages for the overall synthesis. The lipase on solid support could be easily removed from the reaction mixture through simple filtration. Comparable reactions can be performed with the enzyme in solution based on the teachings herein. The product can then be further purified using available chromatographic approaches.

In one embodiment, the process of forming compounds comprising structures I, II and III is performed at a temperature of 30-90°C, or in further embodiments from about 40-75°C, for example, for about 1-168 hours in tert-butyl methyl ether (TBME), acetonitrile, toluene or alake. A person of ordinary skill in the art will recognize that additional ranges of reaction temperature and duration within these explicit ranges are contemplated and are within the present disclosure.

Application

Rapamycin-related compounds as described herein may be used for an anti-proliferative effect. In some anti-proliferative embodiments, the compounds are used in conjunction with coronary stents to prevent restenosis in coronary arteries following balloon angioplasty. The compounds may be formulated in a polymer coating that affords controlled release through the healing period following coronary intervention. Several large clinical studies have demonstrated lower restenosis rates in patients treated with rapamycin eluting stents when compared to bare metal stents, resulting in fewer repeat procedures.

In some anti-proliferative embodiments, the compounds are used for treating cancer, either separately or as an adjunct with other therapies. For instance, it was recently shown that rapamycin inhibited the progression of dermal Kaposi's sarcoma in patients with renal transplants. Other mTOR inhibitors such as temsirolimus (CCI-779) or everolimus (RAD001) are being tested for use in cancers such as glioblastoma multiforme and mantle cell lymphoma. Further, combination therapy of doxorubicin and rapamycin has been shown to drive Akt-positive lymphomas into remission in mice. Akt signaling promotes cell survival in Akt-positive lymphomas and acts to prevent the cytotoxic effects of chemotherapy drugs like doxorubicin or cyclophosphamide. Rapamycin blocks Akt signaling and the cells lose their resistance to the chemotherapy. Compounds related to rapamycin disclosed herein are accordingly believed to be useful to block Akt signaling.

Other applications for the rapamycin-related compounds are as antimicrobial agents and blockers of cell proliferation, either in vitro or in vivo. Many uses for reagents with these functionalities are known to artisans.

The compounds may be provided as pharmaceutically acceptable salts, or in pharmaceutically acceptable diluents or excipients. Pharmaceutically acceptable salts of the compounds described herein may be synthesized according to methods known to those skilled in this art, see, for example Pharmaceutical Salts: Properties, Selection, and Use, P. Heinrich Stahl (Editor), Camille G. Wermuth (Editor) June 2002. Generally, such salts are prepared by reacting the free base forms of these compounds with a stoichiometric amount of the appropriate acid in water or in an organic solvent, or in a mixture of the two; generally, nonaqueous media like ether, ethyl acetate, ethanol, isopropanol, or acetoniite are preferred. Lists of some appropriate salts are found, for example, in Remington’s Pharmaceutical Sciences, 17th ed., Mack Publishing Company, Easton, Pa., 1985.

In some embodiments, the compounds described herein are used in combination with one or more potentiators and/or chemotherapeutic agents for the treatment of cancer or tumors. Examples and descriptions of potentiators and combination therapies are provided in, for example, U.S. Pat. Nos. 6,290,929 and 6,352,844.

The compounds described herein may be administered as a single active drug or a mixture thereof with other anti-cancer compounds, and other cancer or tumor growth inhibiting compounds. The compounds may be administered in oral dosage forms that include tablets, capsules, pills, powders, granules, elixirs, tinctures, suspensions, syrups, and emulsions. Further, the compounds may be administered in intravenous (bolus or infusion), intraperitoneal, subcutaneous, or intramuscular form.

An effective amount of the compounds described herein are typically to be administered in a mixture with suitable pharmaceutical diluents, excipients, extenders, or carriers (termed herein as a pharmaceutically acceptable carrier, or a carrier) suitably selected with respect to the intended form of administration and as consistent with conventional pharmaceutical practices. The deliverable compound will be in a form suitable for oral, rectal, topical, intravenous injection or parenteral administration. Carriers include solids or liquids, and the type of carrier is chosen based on the type of administration being used. The effective amount can be determined as an amount that provides some relief from the symptoms to be alleviated.

Techniques and compositions for making dosage forms useful in the present invention are described, for example, in the following references: 7 Modern Pharmaceutics, Chapters 9 and 10 (Banker & Rhodes, Editors, 1979); Pharmaceutical Dosage Forms: Tablets (Lieberman et al., 1981); Ansel, Introduction to Pharmaceutical Dosage Forms
water, and the like. Example liquid forms include solutions or suspensions in water, pharmaceutically acceptable fats and oils, alcohols or other organic solvents, including esters, emulsions, syrups or elixirs, suspensions, solutions and/or suspensions reconstituted from non-effervescent granules and effervescent preparations reconstituted from effervescent granules. Liquid dosage forms may contain, for example, suitable solvents, preservatives, emulsifying agents, suspending agents, diluents, sweeteners, thickeners, and melting agents.

[0080] Liquid dosage forms for oral administration can contain coloring and flavoring, as needed. In general, water, suitable oil, saline, aqueous dextrose (glucose), and related sugar solutions and glycols such as propylene glycol or polyethylene glycols are suitable carriers for parenteral solutions. Solutions for parenteral administration preferably contain a water-soluble salt of the active ingredient, suitable stabilizing agents, and if necessary, buffer substances. Antioxidizing agents such as sodium bisulfite, sodium sulfite, or ascorbic acid, either alone or combined, are suitable stabilizing agents. Also used are citric acid and its salts and sodium EDTA. In addition, parenteral solutions can contain preservatives, such as benzalkonium chloride, methyl- or propyl-paraben, and chlorobutanol. Suitable pharmaceutical carriers are described in Remington's Pharmaceutical Sciences, Mack Publishing Company, a standard reference text in this field.

[0081] The compounds described herein may also be administered in intranasal form via use of suitable intranasal vehicles, or via transdermal routes, using those forms of transdermal skin patches known to those skilled in these arts. To be administered in the form of a transdermal delivery system, the dosage administration will generally be continuous rather than intermittent throughout the dosage regimen. Parenteral and intravenous forms may also include minerals and other materials to make them compatible with the type of injection or delivery system chosen.

[0082] The compounds set forth herein may also be used in pharmaceutical kits for the treatment of cancer, or other purposes, which comprise one or more containers containing a pharmaceutical composition comprising a therapeutically effective amount of the compound. An effective amount can be determined as an amount that provides some relief from the symptoms to be alleviated. Such kits may further include, if desired, one or more of various components, such as, for example, containers with the compound, containers with one or more pharmaceutically acceptable carriers, additional containers, and instructions. The instructions may be in printed or electronic form provided, for example, as inserts or labels, indicating quantities of the components to be administered, guidelines for administration, and/or guidelines for mixing the components.

[0083] The method of administration of the compounds set forth herein can be any suitable method that is effective in the treatment of the particular cancer or tumor type being treated. Treatment may be oral, rectal, topical, parenteral or intravenous administration or by injection into a tumor or cancer. The method of applying an effective amount also varies depending on the disorder or disease being treated. It is believed that parenteral treatment by intravenous, subcutaneous, or intramuscular application of the compounds set forth herein, formulated with an appropriate carrier, additional cancer inhibiting compound or compounds or diluent to facilitate application will be the preferred method of administering the compounds to mammals.

[0084] The embodiments above are intended to be illustrative and not limiting. Additional embodiments are within the claims. In addition, although the present invention has been
described with reference to particular embodiments, those skilled in the art will recognize that changes can be made in form and detail without departing from the spirit and scope of the invention. Any incorporation by reference of documents above is limited such that no subject matter is incorporated that is contrary to the explicit disclosure herein. All patents, patent applications, and publications referenced herein are hereby incorporated by reference herein to the extent that the incorporated material is not contrary to any of the explicit disclosure herein.

[0085] The following examples illustrate synthetic application of the above discussed methodology. Examples 1-7 are directed to the synthesis of particular embodiments of compounds. Example 6 used Amano Lipase PS-C II. Example 7 formed a dicarbonate from a rapamycin carbonate substrate. The synthesis of compounds in examples 8-10 is shown to be superior to other synthesis approaches based on yields and regioselectivity.

EXAMPLES

[0086] The following materials were purchased from Sigma-Aldrich Company, Fischer Scientific, Inc., Hichrom Limited and LC Laboratories and were used as received. Ultra-pure water was used throughout the experimental. Thin layer chromatography was carried out on Fluka silica gel F254 aluminum backed plates. The plates were visualised by the quenching of Ultra Violet fluorescence (λmax=254 nm) and then permanent staining by a solution of vanillin. Silica gel (particle size 20-50 μm) was used for all column chromatography. 1H NMR spectra were recorded at 250 MHz or 400 MHz and 13C NMR spectra were recorded at 62.5 MHz or 100 MHz using a Bruker DPX250 or AMX400 spectrometer. Deuterated chloroform (CDCl3) was supplied by Cambridge Isotope Laboratories, Inc. and used as solvent. Chemical shifts (δ values) were reported in parts per million (ppm) and all coupling constants (J) were rounded to the nearest 0.5 Hz. C C* denotes a quaternary carbon. Accurate mass data was recorded on either a Finnigan MAT 95 under chemical ionisation (CI) conditions using gaseous ammonia or a Bruker microOTOF under electrospray ionisation (ESI) conditions.

Example 1

42-O-[(4’-Vinyl carbonate)but-1’-oxy carbonyl]rapamycin

[0087]

[0088] Vinyl chloroformate (2.26 mL, 25 mmol) was slowly added to a stirring solution of 1,4-butanediol (0.98 mL, 11 mmol) in anhydrous pyridine (6.00 mL, 74 mmol) at 0°C, under an atmosphere of N2, over a period of 30 minutes. The reaction mixture was stirred for a further 1 hour at 0°C, then allowed to warm to room temperature over a period of 1 hour. The temperature was then raised to 50°C and stirring was continued for a further 1 hour. The reaction was quenched with 14% HCl (40 mL) and the aqueous layer extracted with CH2Cl2 (3x40 mL). The combined organic layers were washed with H2O (2x50 mL) and dried (MgSO4). The solvent was removed in vacuo and the compound purified by column chromatography (hexane/ether, 1:1) to afford 1,4-bis(vinylcarbonate)butane as a colourless oil (94%, 2.38 g). Rf=0.56 (hexane/ether, 1:1). 1H NMR (250 MHz/CDCl3); 1.80-1.85 (m, 4H, OCH2CH2CH2CH2O), 4.24 (t, 4H, OCC(CH2)2CH2C H2O, J=7.5 Hz), 4.59 (dd, 2H, 2xOCH2CH2C H2O, J=6.0, 2.0 Hz), 4.92 (dd, 2H, 2xOCH2CH2C H2O, J=14.0, 2.0 Hz), 7.08 (dd, 2H, 2xOCH2CH2C H2O, J=14.0, 6.0 Hz). 13C NMR (60 MHz/ CDCl3); 25.4 (OCH2CH2CH2O), 68.2 (OCH2CH2CH2O), 98.3 (2xOCH2CH2O), 143.0 (2xOCH2CH2O), 153.1 (2xOCH2CH2O).

[0089] A mixture of rapamycin (0.15 g, 0.16 mmol), 1,4-bis(vinyl carbonate)butane (0.23 g, 0.98 mmol) and Novozyme 435 (0.15 g) in anhydrous tert-butyl methyl ether (TBME) (2.5 mL) was stirred at 60°C under an atmosphere of N2 for 18 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N2. The residue was purified by column chromatography (hexane/acetonitrile, 3:1) to furnish the title compound as a white solid (86%, 0.155 g). Rf=0.32 (hexane/acetonitrile, 2:1). 1H NMR (400 MHz/CDCl3); 1.70-1.89 (m, 4H), 4.19 (m, 2H), 4.24 (t, 2H), 4.49-4.56 (m, 1H), 4.59 (dd, 1H), 4.92 (dd, 1H), 7.08 (dd, 1H). 13C NMR (100 MHz/CDCl3); 25.1, 25.1, 67.8, 68.0, 80.1, 97.8, 142.6, 152.7, 155.2. MS (ESI-TOF) m/z 1122.6 [M+Na]+.

Example 2

42-O-(cis-Octadec-9′-enoyl carbonate)rapamycin

[0090]

[0091] Vinyl chloroformate (0.29 mL, 3.13 mmol) was slowly added to a solution of oleyl alcohol (0.50 mL, 1.58 mmol) in anhydrous pyridine (5 mL, 62 mmol) at 0°C, under an atmosphere of N2 over a period of 30 minutes. The reaction mixture was stirred for a further 1 hour at 0°C, then allowed to warm to room temperature over a period of 1 hour. The temperature was then raised to 50°C and stirring was continued for a further 1 hour. The reaction was quenched with 15% HCl (35 mL) and the aqueous layer extracted with CH2Cl2 (3x35 mL). The combined organic layers were washed with H2O (2x50 mL) and dried (MgSO4). The solvent
was removed in vacuo and the compound purified by column chromatography (hexane/ether, 5:1) to afford cis-octadec-9-enyl vinyl carbonate as a colourless liquid (95%, 0.50 g). Rf=0.82 (hexane/ether, 3:1). 1H NMR (250 MHz/CDCl3); 0.88 (t, 3H, CH3CH2CH3), 1.27 (s, 16H, CH2CH2CH3CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2C1H3) 1.30 (t, 6H, CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2C1H3), 1.69 (p, 2H, CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2C1H3), 1.97-2.05 (m, 4H, CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2CH2C1H3), 4.19 (t, 2H, CH2O(C-O)OCH2CH2C1H3), 4.57 (dd, 1H, CH2O(C-O)OCH2CH2C1H3, J=6.0 Hz), 4.91 (dd, 1H, CH2O(C-O)OCH2CH2C1H3, J=14.0 Hz), 5.28-5.41 (m, 2H, CH2O(C-O)OCH2CH2C1H3), 7.09 (dd, 1H, CH2O(C-O)OCH2CH2C1H3, J=14.0, 6.0 Hz). 13C NMR (60 MHz/CDCl3); 15.1 (CH3), 23.1 (CH3), 26.0 (CH2), 27.6 (CH2), 27.6 (CH2), 28.9 (CH2), 29.6 (CH2), 29.7 (CH2), 29.8 (CH2), 29.8 (CH2), 29.9 (CH2), 29.9 (CH2), 30.1 (CH2), 30.2 (CH2), 32.2 (CH2), 69.2 (CH2), 98.0 (CH2), 130.0 (CH2), 130.4 (CH2), 145.0 (CH2), 153.2 (C=O). HRMS m/z (Cl, Na)I found 339.2902 [M+H]+, requires C27H39O5 339.2899.

Example 3

42-O—[(S)-2,3′-Dihydroxypropoxypolyoxycarbonyl]rapamyecin

[0093]

[0094] Ethyl chloroformate (1.15 mL, 12 mmol) was slowly added dropwise to a solution of (R)-2,2-dimethyl-1,3-dioxolan-4-methanol (0.8 g, 6.05 mmol) in anhydrous pyridine (6 mL, 74 mmol) at 0°C. under an atmosphere of nitrogen over a period of 30 minutes. The reaction mixture was stirred for a further 1 hour at 0°C, then at room temperature for 1 hour and finally at 50°C for 1 hour. The mixture was diluted with H2O (40 mL) and the aqueous layer was extracted with CH2Cl2 (3×35 mL). The combined organic layers were washed with H2O (2×50 mL), dried (MgSO4) and concentrated in vacuo to afford a crude light yellow liquid. The product was purified by column chromatography (hexane/ether, 4:1) to furnish (S)-2,2-dimethyl-1,3-dioxolan-4-methyl ethyl carbonate as a colourless liquid (83%, 1.02 g). Rf=0.65 (hexane/ether, 1:1). 1H NMR (250 MHz/CDCl3); 1.21 (s, 3H, OCH2CH2CH2C1H3), 1.31 (t, 3H, OCH2CH2CH2C1H3), 1.37 (s, 3H, CH3), 1.44 (s, 3H, CH3), 3.79 (dd, 1H, C1OCH3, J=8.5, 6.0 Hz), 4.09 (dd, 1H, C1OCH3, J=8.5, 6.5 Hz), 4.16 (dd, 1H, CH2CH2O—O, J=6.0, 5.0 Hz), 4.18 (d, 2H, OCH2CH2C1H3, J=7.0 Hz), 4.23 (dd, 1H, CH2CH2O—O, J=7.0, 4.5 Hz), 4.35 (q, 1H, CH2, J=6.0 Hz). 13C NMR (60 MHz/CDCl3); 14.6 (OCH2CH2C1H3), 25.7 (C1OCH3), 27.1 (C1OCH3), 64.6 (CH2CH2C1H3), 66.7 (C1OCH3), 68.1 (CH2CH2O—O), 73.7 (CH2), 110.3 (C=O), 155.4 (C=O). HRMS m/z (Cl, Na)I found 205.1083 [M+H]+, requires C9H12O2 205.1076.

[0092] A mixture of rapamyecin (0.03 g, 0.0528 mmol), cis-octadec-9-enyl vinyl carbonate (0.067 g, 0.20 mmol) and Novozyme 435 (0.03 g) in anhydrous tert-butyl methyl ether (TBME) (0.5 mL) was stirred at 60°C. under an N2 atmosphere for 18 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N2. The residue was purified by column chromatography (hexane/acetone, 4:1) to furnish the title compound as a white solid (78%, 0.031 g). Rf=0.71 (THF/acetone, 1:1). 1H NMR (400 MHz/CDCl3); 0.88 (t, 3H, 1.26-1.50 (m, 22H), 1.69-1.87 (m, 21H), 1.94-2.03 (m, 4H), 4.13 (t, 21H), 4.49-4.55 (m, 11H), 5.31-5.36 (m, 21H). 13C NMR (100 MHz/CDCl3); 14.1, 22.7, 23.9, 26.5, 28.6, 29.1, 29.2, 29.3, 29.4, 29.4, 29.5, 29.5, 29.8, 31.2, 31.9, 68.1, 80.0, 129.8, 130.0, 155.0. MS (ESI-TOF) m/z 1230.8 [M4Na]+.

[0095] A mixture of rapamyecin (0.3 g, 0.328 mmol), (S)-2,2-dimethyl-1,3-dioxolan-4-methyl ethyl carbonate (0.47 g, 2.30 mmol) and Novozyme 435 (0.3 g) in anhydrous tert-butyl methyl ether (TBME) (3.0 mL) was stirred at 60°C.
under an N₂ atmosphere for 18 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N₂. The residue was purified by column chromatography (hexane/acetone, 4:1) and then subjected to acid catalysed deprotection. The crude product (0.333 g) was dissolved in THF (3.5 mL), cooled to 0°C and H₂SO₄ (2.1 mL, 2N) was added dropwise over a period of 25 minutes. The mixture was stirred for 4 hours at 0°C then at room temperature for a further 20 hours. After TLC had indicated complete consumption of 42-O—[(S)-2,2',3'-dimethyl-1,3-dioxolane-4-methoxy carbonyl]rapamycin, the mixture was diluted with brine (5 mL) and the aqueous layer was extracted with EtOAc (3x5 mL). The combined organic layers were washed with H₂O (5 mL), 5% NaHCO₃ (5 mL) and then brine (5 mL). The organic layers were dried (MgSO₄) and concentrated in vacuo to afford a crude yellow oil. The product was purified by column chromatography (hexane/acetone, 2:1) to furnish the title compound as a white solid. R_f 0.08 (THF/heptane, 1:1). ¹H NMR (400 MHz, CDCl₃): 3.61 (d, 1H), 3.70-3.75 (m, 1H), 3.97 (p, 1H), 4.24 (d, 2H), 4.49-4.56 (m, 1H). ¹³C NMR (100 MHz,CDCl₃): 63.1, 68.5, 69.9, 80.5, 154.9. MS (ESI-TOF) m/z 1054.6 [M+Na]⁺.

Example 4

42-O—[(S)-2,2',3'-Dihydroxyproplyoxy carbonyl]rapamycin

---

Novozyme 435 (0.1 g) was added to a solution of (R)-2,2-dimethyl-1,3-dioxolane-4-methanol (0.107 g, 0.81 mmol) and divinyl carbonate (0.57 g, 3.22 mmol) in toluene (1.96 mL). The mixture was stirred at 60°C under N₂ for 16 hours. After TLC had indicated complete consumption of starting material, the enzyme was filtered off and washed with THF. The THF, toluene, acetaddehyde and excess divinyl carbonate were removed in vacuo and the crude product was purified by column chromatography (hexane/ether, 2.5:1) to afford (S)-2,2-dimethyl-1,3-dioxolane-4-methyl vinyl carbonate as a colourless liquid (86%, 0.14 g). R_f 0.54 (hexane/ether, 2:1). ¹H NMR (250 MHz,CDCl₃): 1.37 (s, 3H, CH₃), 1.44 (s, 3H, CH₃), 3.81 (dd, 1H, OCH₂, J=5.5, 8.5 Hz), 4.11 (dd, 1H, OCH₂, J=6.5, 8.5 Hz), 4.22 (dd, 1H, C=O)OCH₂, J=5.0, 7.5 Hz), 4.22 (dd, 1H, C=O)OCH₂, J=5.0, 7.5 Hz), 4.22 (dd, 1H, C=O)OCH₂, J=6.0, 8.5 Hz), 4.38 (q, 1H, CH₂, J=6.0 Hz), 4.60 (dd, 1H, CH₂=CH₂, J=2.0, 6.0 Hz), 4.93 (dd, 1H, CH₂=CH₂, J=2.0, 14.0 Hz), 7.08 (dd, 1H, CH₂=CH₂, J=6.0, 14.0 Hz). ¹³C NMR (60 MHz,CDCl₃): 25.7 (CH₃), 27.0 (CH₃), 66.5 (OCH₂), 68.7 (C=O)OCH₂), 73.5 (CH), 98.5 (CH=CH₂), 110.4 (CH), 142.9 (CH=CH₂), 155.0 (C=O). HRMS m/z (Cl, NH₂) found 203.0920 [M+H]⁺, requires C₇H₁₃O₂ 203.0920.

Example 5

42-O-(3'-Hydroxypropoxy carbonyl)rapamycin

---

[0098] A mixture of rapamycin (0.1 g, 0.109 mmol), (S)-2,2-dimethyl-1,3-dioxolane-4-methyl vinyl carbonate (0.15 g, 0.64 mmol) and Novozyme 435 (0.15 g) in anhydrous tert-butyl methyl ether (TBME) (2.0 mL) was stirred at 60°C under an N₂ atmosphere for 24 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N₂. The residue was purified by column chromatography (hexane/acetone, 3:1) and then subjected to acid catalysed deprotection. The crude product (0.113 g) was dissolved in THF (1.5 mL), cooled to 0°C and H₂SO₄ (1.2 mL, 2N) was added dropwise over a period of 25 minutes. The mixture was stirred for 4 hours at 0°C then at room temperature for a further 20 hours. After TLC had indicated complete consumption of 42-O—[(S)-2,2'-dimethyl-1,3-dioxolane-4-methoxy carbonyl]rapamycin, the mixture was diluted with brine (2 mL) and the aqueous layer was extracted with EtOAc (3x2 mL). The combined organic layers were washed with H₂O (2 mL), 5% NaHCO₃ (2 mL) and then brine (2 mL). The organic layers were dried (MgSO₄) and concentrated in vacuo to afford a crude yellow oil. The product was purified by column chromatography (hexane/acetone, 2:1) to furnish the title compound as a white solid. R_f 0.08 (THF/heptane, 1:1). ¹H NMR (400 MHz,CDCl₃): 3.61 (d, 1H), 3.70-3.75 (m, 1H), 3.97 (p, 1H), 4.24 (d, 2H), 4.49-4.56 (m, 1H). ¹³C NMR (100 MHz,CDCl₃): 63.1, 68.5, 69.9, 80.5, 154.9. MS (ESI-TOF) m/z 1054.6 [M+Na]⁺.

Example 5

42-O-(3'-Hydroxypropoxy carbonyl)rapamycin

---

[0099] Vinyl chloroformate (0.86 mL, 9.39 mmol) was slowly added dropwise to a solution of 1,3-propanediol (2.14 g, 28 mmol) in anhydrous pyridine (8 mL) at 0°C over a period of 1 hour. The reaction was stirred for a further 30 minutes at 0°C, then at room temperature for 1 hour and finally at 50°C for 30 minutes. The reaction mixture was
A solution of 3-hydroxypyrrol vinyl carbonate (0.456 g, 3.12 mmol) and triethylamine (1.09 mL, 7.8 mmol) in anhydrous EtOAc (12 mL) was cooled to 0°C. and trimethylethylsilyle chloride (0.79 mL, 6.24 mmol) in anhydrous EtOAc (8 mL) was added over a period of 15 minutes. The reaction was allowed to warm to room temperature and was stirred for an additional 30 minutes. The mixture was then poured onto ice water (30 mL) and the aqueous layer was extracted with EtOAc (3x30 mL). The combined organic layers were washed with H2O (40 mL), dried (MgSO4) and concentrated in vacuo to furnish a crude yellow liquid. The product was purified by column chromatography (hexane/ether, 8:1) to afford 3-(trimethylsilyloxy)propyl vinyl carbonate as a colourless (78%, 0.53 g). Rf = 0.73 (hexane/ether, 8:1). 

[0102] A mixture of rapamycin (0.06 g, 0.066 mmol), 3-(trimethylsilyloxy)propyl vinyl carbonate (0.072 g, 0.328 mmol), Novozyme 435 (0.08 g) and molecular sieves (5 Å) in anhydrous tert-butyl methyl ether (TBME) (1.0 mL) was stirred at 60°C. under an N2 atmosphere for 72 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N2. The residue was purified by column chromatography (hexane/acetone, 3:1) and then subjected to acid catalysed deprotection. The crude product (0.0649 g) was dissolved in THF (0.6 mL), cooled to 0°C and H2SO4 (0.28 mL, 0.5N) was added dropwise over a period of 15 minutes. Stirring was continued for 2 hours at 0°C and then at room temperature for a further 1 hour. After TLC had indicated complete consumption of 42-O-[3-(trimethylsilyloxy)propoxy]carbonylrapamycin the mixture was transferred to a separatory funnel and the aqueous layer was extracted with EtOAc (3x2 mL). The combined organic layers were washed with H2O (2 mL), 5% NaHCO3 (2 mL) and then brine (2 mL). The organic layers were dried (MgSO4) and concentrated in vacuo to afford a colourless semi-solid. The product was purified by column chromatography (hexane/acetone, 2:1) to furnish the title compound as a white solid. Rf = 0.26 (THF/heptane, 1:1). 

42-O-[4'-Vinyl carbonate]but-1'-oxy)carbonyl]rapamycin (Alternative Lipase) 

[0103] 

[0104] A mixture of rapamycin (0.03 g, 0.0328 mmol), 1,4-bis(vinylcarbonate)butane (0.045 g, 0.197 mmol) and Amano Lipase PS-C II (0.03 g) in anhydrous tert-butyl methyl ether (TBME) (0.5 mL) was stirred at 60°C. under an atmosphere of N2 for 18 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N2. The residue was purified by column chromatography (hexane/acetone, 2:1) to furnish the title compound as a white solid (76%, 0.0276 g). Rf = 0.32 (hexane/acetone, 2:1). 

The product was purified by column chromatography (hexane/acetone, 8:1) to afford the title compound as a white solid. Rf = 0.26 (THF/heptane, 1:1). 

[0102] H NMR (250 MHz/CDCl3): 1.97 (p, 2H, CH3CH2CH2J, J=5.0 Hz), 2.66 (s, 1H, OH), 3.74 (t, 2H, CH2OH, J=5.0 Hz), 4.35 (t, 2H, OCH2CH2J, J=5.0 Hz), 4.59 (dd, 1H, CH=CHO trans, J=7.5, 2.5 Hz), 4.92 (dd, 1H, CH=CHO cis, J=12.5, 2.5 Hz), 7.08 (dd, 1H, CH=CH=J, J=14.0, 5.0 Hz). 

[0102] 13C NMR (60 MHz/CDCl3): 31.4 (CH3CH2CH2J), 58.6 (CH2OH), 65.6 (OCH2CH2J), 97.9 (C=O), 142.5 (CH2=CHJ), 152.9 (C=O), HRMS m/z (Cl, NH4) found 219.1058 [M+H]+ requires C8H13O2Si 219.1053.

Example 6
42-O-[4'-Vinyl carbonate]but-1'-oxy)[carbonyl]rapamycin
Example 7
42-O-[(4'-Dodecyl carbonate)but-1'-oxy carbonyl]rapamycin

[0105]

A mixture of 42-O-[(4'-vinyl carbonate)but-1'-oxy carbonyl]rapamycin (0.029 g, 0.0264 mmol), 1-dodecanol (0.025 g, 0.133 mmol), Novozyme 435 (0.045 g) and molecular sieves (5 Å) in anhydrous acetonitrile (0.5 mL) was stirred at 60°C under an atmosphere of N₂ for 18 hours. The enzyme was filtered off, washed with acetonitrile and the combined organic solvent concentrated under N₂. The residue was purified by column chromatography (hexane/acetone, 4:1) to furnish the title compound as light yellow oil. Rf=0.38 (hexane/acetone, 2:1). 

\(^1\)H NMR (400 MHz/CDCl₃); 0.88 (t, 3H), 1.21-1.39 (m, 14H), 1.29-1.43 (m, 4H), 1.60-1.70 (m, 4H), 1.71-1.81 (m, 2H), 3.62-3.72 (m, 2H), 4.10-4.20 (m, 4H), 4.49-4.56 (m, 1H), \(^13\)C NMR (100 MHz/CDCl₃); 14.1, 22.7, 25.2, 25.7, 25.7, 28.7, 28.9, 29.2, 29.3, 29.4, 29.5, 29.6, 31.9, 67.6, 68.2, 70.5, 80.1, 155.3, 155.4. MS (ESI-TOF) m/z 1264.7 [M+Na]+.

[0107] The following examples are included to illustrate improved yields in comparison with U.S. Pat. No. 5,260,300.

Example 8
42-O-(Ethoxycarbonyl)rapamycin
A mixture of rapamycin (0.06 g, 0.0656 mmol), diethyl carbonate (0.047 g, 0.0394 mmol), Novozyme 435 (0.09 g) and molecular sieves (5 Å) in anhydrous tert-butyl methyl ether (TBME) (1.0 mL) was stirred at 60°C, under an N₂ atmosphere for 18 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N₂. The residue was purified by column chromatography (hexane/acetone, 3:1) to furnish the title compound as a white solid (79%, 0.0509 g). Rf = 0.56 (THF/heptane, 1:1). ¹H NMR (400 MHz/CDCl₃): 1.31 (t, 3H), 4.22 (q, 2H), 4.48-4.55 (m, 1H). ¹³C NMR (100 MHz/CDCl₃): 14.2, 65.8, 80.0, 154.8. MS (ESI-TOF) m/z 1008.6 [M+Na]⁺.

Example 9
42-O-(Vinlyoxycarbonyl)rapamycin

A mixture of mercury(II) oxide yellow (162 g, 750 mmol), mercury(II) acetate (6 g, 25 mmol), ethanol (90 mL) and H₂O (30 mL) was placed in a 500 mL three-necked flask equipped with a magnetic stirrer, thermometer, reflux condenser and addition funnel. The mixture was stirred at room temperature for 30 minutes until homogeneous. Ethyl vinyl ether (11.8 g, 1650 mmol) was added to the reaction mixture over a period of 30 minutes, during which time the temperature rose to 55°C. The reaction mixture was filtered whilst hot then allowed to crystallise for 3 hours at 4°C. The crystals were washed with ethanol and dried under vacuum for 24 hours. Mercuric diacetaledehyde was isolated as a white solid (55%, 118.8 g). ¹H NMR (250 MHz/CDCl₃): 2.32 (d, 6H, 2xCH₃, J=5.0 Hz), 9.33 (q, 2H, 2xCH, J=2.5 Hz). ¹³C NMR (60 MHz/CDCl₃): 51.1 (2xCH₃), 199.4 (2xC=O).

Example 10
42-O-(Allyloxy carbonyl)rapamycin

A mixture of merccuric diacetaledehyde (110 g, 381.02 mmol) in anhydrous THF (40 mL) was placed in a 250 mL three-necked flask equipped with a magnetic stirrer, thermometer, reflux condenser fitted with a CaCl₂ guard tube and an addition funnel. The mixture was stirred and cooled to 0°C in an ice bath. Phosgene (14 g, 140 mmol) in anhydrous toluene (20%) was added gradually over a period of 20 minutes. The temperature was maintained at 0°C for 1 hour with good stirring and then allowed to warm to room temperature for a further 1 hour. After this time the temperature was slowly raised to 60°C and maintained for 1 hour. The product, divinyl carbonate, was obtained as a solution in toluene by distillation at atmospheric pressure. ¹H NMR (250 MHz/CDCl₃): 4.95 (dd, 2H, 2xCH=CH²) trans, J=6.0, 2.0 Hz), 5.35 (dd, 2H, 2xCH=CH²) cis, J=14.0, 2.0 Hz), 7.50 (dd, 2H, 2xC H=CH₂, J=14.0, 6.0 Hz). ¹³C NMR (60 MHz/CDCl₃): 98.5 (CH=CH₂), 99.2 (CH=CH₂), 143.1 (2xC=CH₂), 151.1 (C=O).

Example 11
42-O-(Vinlyoxycarbonyl)rapamycin

A mixture of rapamycin (0.03 g, 0.0328 mmol), diallyl carbonate (0.022 g, 0.197 mmol) and Novozyme 435 (0.045 g) in anhydrous tert-butyl methyl ether (TBME) (0.5 mL) was stirred at 60°C, under an anhydrous tert-butyl methyl ether (TBME) (0.5 mL) and anhydrous toluene (0.13 mL) was stirred at 60°C, under an N₂ atmosphere for 18 hours. The enzyme was filtered off, washed with TBME and the combined organic solvent concentrated under N₂. The residue was purified by column chromatography (hexane/acetone, 3:1) to furnish the title compound as a white solid (88%, 0.0283 g). Rf = 0.62 (THF/heptane, 1:1). ¹H NMR (400 MHz/CDCl₃): 4.54-4.58 (m, 1H), 4.58 (dd, 1H), 4.92 (dd, 1H), 7.11 (dd, 1H). ¹³C NMR (100 MHz/CDCl₃): 80.9, 97.8, 142.9, 152.6. MS (ESI-TOF) m/z 1006.6 [M+Na]⁺.
N₂ atmosphere for 18 hours. The enzyme was filtered off, washed with TBME, and the combined organic solvent concentrated under N₂. The residue was purified by column chromatography (hexane/acetone, 2.5:1) to furnish the title compound as a white solid (73%, 0.024 g). R₆=0.58 (THF/heptane, 1:1). ¹H NMR (400 MHz/CDCl₃): δ 4.50-4.57 (m, 1H), 4.63 (d, 2H), 5.27 (dd, 2H), 5.91-5.98 (m, 1H). ¹³C NMR (100 MHz/CDCl₃): 68.3, 80.3, 118.8, 131.7, 154.6. MS (ESI-TOF) m/z 1020.5 [M+Na]⁺.

[0116] The embodiments above are intended to be illustrative and not limiting. Additional embodiments are within the claims. In addition, although the present invention has been described with reference to particular embodiments, those skilled in the art will recognize that changes can be made in form and detail without departing from the spirit and scope of the invention. Any incorporation by reference of documents above is limited such that no subject matter is incorporated that is contrary to the explicit disclosure herein. All patents, patent applications, and publications referenced herein are hereby incorporated by reference herein.

What is claimed is:

1. A compound comprising structure (I), (II), or (III) wherein:

   R² is \(-C(=O)OR¹\), \(-C(=S)OR¹\), \(-C(=O)SR²\), or \(-C(=S)SR²\) and,

   R¹ is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, or Ar\(-\text{CH}_n\)- where \(n\) is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, where at least one hydrogen of R¹ is replaced by a hydroxyl group, an amino group, a thio group, a phosphate group, a carbonyl group, a sulfonate group, a sulfonamide group, a carbonate group or a combination thereof.

   R³ is \(-C(=O)OR²\), \(-C(=S)OR²\), \(-C(=O)SR²\), or \(-C(=S)SR²\) and,

   R² is \(C_{\text{aryl}}, C_{\text{alkyl}}, C_{\text{alkenyl}}, C_{\text{alkynyl}}, C_{\text{cycloalkyl}}, \text{heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, or an aromatic group,}

   wherein the aromatic group is naphthyl, biphenyl, anthryl, tetrahydropyranthyl, phenanthryl, indane, tetracenyl, pentacenyl, triphenylbenzenyl, triazolyl, triazolyl, oxazolyl, isoxazolyl, thiadiazolyl, thiofuranyl, pyrimidinyl, pyrazinyl, thiazinyl, phenylsubstituted with amine, phosphoryl, phosphate, sulfonyl, sulfonate, sulfonamide,

   R⁴ and R⁶ are each independently \(-C(=O)O-\), \(-C(=S)O-\), \(-C(=O)S-\), or \(-C(=S)S-\).

   A is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, and \(-\text{CH}_n\)- where \(n\) is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl and,

   B is rapamycin or derivative thereof, alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, and Ar\(-\text{CH}_n\)- where \(n\) is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl.

   wherein alkyl is a linear or branched saturated aliphatic hydrocarbon group, alkenyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond, alkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon triple bond, cycloalkyl is a cyclic saturated aliphatic hydrocarbon group, heteroalkyl is a linear or branched saturated al-
phatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, heteroalkenyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heterocyclyl is a cyclic saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, or a pharmaceutically acceptable salt thereof.

2. The compound comprising claim 1, wherein at least one hydrogen of R^1 is replaced by a hydroxyl group.

3. A process of making a compound comprising structure (IX),

\[
\text{(IX)}
\]

comprising the steps of:

(1) obtain a donor, and

(2) react the donor with an unprotected hydroxyl group at the '42 position of rapamycin or derivative thereof in the presence of a lipase to make an adduct.

wherein:

R is \(-\text{C}(=\text{O})\text{OR}'\), \(-\text{C}(=\text{S})\text{OR}'\), \(-\text{C}(=\text{O})\text{SR}'\), or \(-\text{C}(=\text{S})\text{SR}'\) and,

R' is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, or Ar\(-(\text{CH}_2)_n\) where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl.

4. The process of claim 3 wherein the donor is a carbonate, \(\text{O},\text{O}'\)-thiocarbonate, \(\text{O},\text{S}\)-thiocarbonate, \(\text{O},\text{S}\)-dithiocarbonate, or \(\text{S},\text{S}'\)-dithiocarbonate donor of a general structure (IV)

\[
\text{(IV)}
\]

wherein:

R'^1 is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, or Ar\(-(\text{CH}_2)_n\) where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl.

5. The process of claim 4 wherein the process further comprising the step of removing the protection group from the hydroxyl group, the amino group, the thio group, the phosphate group, the carbonyl group, the sulfonate group, the sulfonamide group, the sulfamide group, or the carbonate group is protected by a protection group, and

R'^2 is a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or alkyl group.

wherein alkyl is a linear or branched saturated aliphatic hydrocarbon group, alkenyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond, alkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond, cycloalkyl is a cyclic saturated aliphatic hydrocarbon group, heteroalkyl is a linear or branched saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, heteroalkenyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, and the hydroxyl group, the amino group, the thio group, the phosphate group, the carbonyl group, the sulfonate group, the sulfonamide group, the sulfamide group, or the carbonate group is protected by a protection group, and

R'^2 is a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or alkyl group.

5. The process of claim 4 wherein the process further comprising the step of removing the protection group from the hydroxyl group, the amino group, the thio group, the phosphate group, the carbonyl group, the sulfonate group, the sulfonamide group, the sulfamide group, the carbonate group or a combination thereof to make a derivative of rapamycin comprising structure (I) from the adduct,
wherein,
R$^2$ is $-C(=O)OR^1$, $-C(=S)OR^1$, $-C(=O)SR^1$, or $-C(=S)SR^2$ and,
R$^3$ is alkyl, alkenyl, alkyne, cycloalkyl, heteroalkyl, heteroalkynyl, heteroalkenyl, heteroalkenynyl, heterocyclyl, or Ar$-\text{(CH}_\text{2})_n$ — where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, where at least one hydrogen of R$^3$ is replaced by a hydroxyl group, an amino group, a thio group, a phosphate group, a carbonyl group, a sulfonate group, a sulfonamide group, a sulfamide group, a carbonate group or a combination thereof.

6. The process of claim 4 wherein at least one hydrogen of R$^3$ is replaced by a hydroxyl group.

7. The process of claim 4 wherein R$^3$ is a vinyl group.

8. The process of claim 3 wherein the donor is a carbonate, O,O'-thiocarbonate, O,S-thiocarbonate, O,S-dithiocarbonate, or S,S'-dithiocarbonate donor of a general structure (V)

wherein:
R$^2$ is C$_7$-C$_{22}$ alkyl, C$_7$-C$_{22}$ alkenyl, C$_7$-C$_{22}$ alkyne, C$_9$-C$_{12}$ cycloalkyl, heteroalkyl, heteroalkynyl, heteroalkenyl, heteroalkenynyl, heterocyclyl, or an aromatic group,
wherein the aromatic group is Ar$-\text{(CH}_\text{2})_n$ — where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, naphthyl, biphenyl, anthryl, tetrahydroanthryl, phenanthryl, indene, tetracenyl, pentacenyl,triphenylenyl, imidazolyl, triazolyl, tetrazolyl, oxazolyl, isoxazolyl, thiazolyl, isothiazolyl, thiophenyl, pyrimidinyl, pyrazinyl, thiazinyl, phenyl substituted with amine, phosphoryl, phosphate, sulfonoyl, sulfonate, sulfonamide,
wherein alkyl is a linear or branched saturated aliphatic hydrocarbon group, alkenyl is a linear, branch, or cyclic alkyl group containing at least one carbon-carbon double bond, alkynyl is a linear, branch, or cyclic alkyl group containing at least one carbon-carbon triple bond, cycloalkyl is a cyclic saturated hydrocarbon group, heteroalkyl is a linear or branched saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branch, or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heteroalkenyl is a linear, branch, or cyclic alkyl group containing at least one carbon-carbon triple bond with at least one carbon atom being replaced by an atom other than carbon, heterocyclyl is a cyclic saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, and R$^2$ is a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or aryl group.

9. The process of claim 8 wherein R$^2$ is a vinyl group.

10. The process of claim 8 wherein the adduct comprising structure (II)

wherein,
R$^2$ is $-C(=O)OR^1$, $-C(=S)OR^1$, $-C(=O)SR^1$, or $-C(=S)SR^2$ and,
R$^3$ is C$_7$-C$_{22}$ alkyl, C$_7$-C$_{22}$ alkenyl, C$_7$-C$_{22}$ alkyne, C$_9$-C$_{12}$ cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkenynyl, heterocyclyl, or an aromatic group.

11. The process of claim 3 wherein the donor is symmetric, asymmetric or cyclic carbones including alkyl carbones, dialkyl carbones, vinyl carbones, divinyl carbones, alkyl vinyl carbones, and cyclic carbones.

12. The process of claim 11 wherein the donor is diethyl carbonate, diocyl carbonate, ethyl octyl carbonate, dilaoyl carbonate, cis-octadec-9-6yl vinyl carbonate, divinyl carbonate, 1,4-bis(vinylcarbonate)butane, 1,3-dioxan-2-one, 3-(trimethylsilyloxy)propyl vinyl carbonate, 3-(tert-butylidimethylsilyloxy)propyl vinyl carbonate, (S)-2,2-dimethyl-1,3-dioxolan-4-methyl vinyl carbonate and (S)-2,2-dimethyl-1,3-dioxolan-4-methyl ethyl carbonate.

13. The process of claim 3 wherein the donor is a bifunctional donor of a general structure (VI)

wherein:
R$^2$ and R$^3$ are each independently $-C(=O)O$, $-C(=S)O$, $-C(=O)S$, or $-C(=S)S$,
A is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkenynyl, heterocyclyl, and $-\text{(CH}_\text{2})_n$ — where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl,
wherein alkyl is a linear or branched saturated aliphatic hydrocarbon group, alkenyl is a linear, branch, or cyclic alkyl group containing at least one carbon-carbon double bond, alkynyl is a linear, branch, or cyclic alkyl group containing at least one carbon-carbon triple bond, cycloalkyl is a cyclic saturated aliphatic hydrocarbon group, heteroalkyl is a linear or branched saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, and R$^2$ is a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or aryl group.
being replaced by an atom other than carbon, heteroalkenyl is a linear, branched or cyclic alkyl group containing at least one carbon—carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branched or cyclic alkyl group containing at least one carbon—carbon triple bond with at least one carbon atom being replaced by an atom other than carbon.  

R⁻ and R⁺ are each independently a vinyl, ethyl, propyl, butyl, pentyl, hexyl, heptyl, octyl, or allyl group.

14. The process of claim 13 wherein R⁻ and R⁺ are each independently a vinyl group.

15. The process of claim 13 wherein the bifunctional donor is 1,4-bis(vinyl carbonate)butane, 1,3-bis(vinyl carbonate)propane, 1,2-bis(vinyl carbonate)ethane, 1,4-bis(ethylenecarbonate)butane, 1,3-bis(ethylenecarbonate)propane, 1,2-bis(ethylenecarbonate)ethane, 1,4-bis(methyl vinyl carbonate) cyclohexane or 2,5-bis(methyl vinyl carbonate) furan.

16. The process of claim 13 wherein the process further comprise the step of reacting the adduct with a compound of formula B—OH, where OH is a hydroxyl group and B is rapamycin or derivative thereof, alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, heteroalkenyl, heteroalkynyl, heterocyclic and Ar—(CH₂)ₙ— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, to make a rapamycin derivative comprising structure (III).

17. The process of claim 16 wherein the hydroxyl group in B—OH is the 42-hydroxyl of rapamycin or derivative thereof.

18. The process of claim 16 wherein B—OH is alkyl alcohols, alkenyl alcohols, alkynyl alcohols, aryl alcohols, diols, triols, polyols, cyclic alcohols, thetitol, inositol, or polyethers.

19. The process of claim 3 wherein the lipase is Aspergillus niger lipase, Candida antarctica “A” lipase, Candida antarctica “B” lipase, Amano Lipase PS-C II, Candida rugosa lipase, Mucor miehei lipase, Pseudomonas cepacia lipase (lipase PS), Rhizopus delemar lipase, or alkane.

20. The process of claim 3 wherein the lipase is Candida antarctica “B” lipase.

21. The process of claim 3 wherein the lipase is Amano Lipase PS-C II.

22. A method of treating a disease comprising administration to a subject in need thereof a therapeutically effective amount of a compound comprising the structure (I), (II), or (III) or a pharmaceutically acceptable salt thereof, wherein:

- the disease is organ and tissue transplant rejection, autoimmune disease, proliferative disorder, restenosis, cancer, or microbial infection,
- R⁻ is —C(=O)OR¹, —C(=S)OR¹, —C(=O)SR¹, or —C(=S)SR¹,
- R⁺ is alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, heteroalkenyl, heteroalkynyl, heterocyclic or Ar—(CH₂)ₙ— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, where at least one hydrogen of R⁺ is replaced by a hydroxyl group, an amino group, a thio group, a phosphate group, a carboxyl group, a sulfonate group, a sulfonamide group, a sulfamido group, a carbonate group or a combination thereof.
- R⁻ is —C(=O)OR², —C(=S)OR², —C(=O)SR², or —C(=S)SR²,
- R⁺ is C₃₋₅ alkyl, C₅₋₁₂ alkenyl, C₅₋₁₄ alkyny, C₅₋₁₄ cycloalkyl, heteroaryl, heteroalkenyl, heteroalkynyl, heterocyclic, or an aromatic group,
- wherein the aromatic group is naphthyl, biphenyl, anthryl, tetrahydropyridyl, phenanthryl, indane, tetracycienyl, pentacycienyl, triphenylmethyl, imidazolyl, triazolyl, tetrazolyl, oxazolyl, isoxazolyl, thiazolyl, isothiazolyl, thiofuranyl, pyrimidinyl, pyrazinyl, thiazinyl, phenyl substituted with amine, phosphoryl, phosphate, sulfonyl, sulfonate, sulfonamide,
- R⁻ and R⁺ are each independently —C(=O)O—, —C(=S)O—, —C(=O)S—, or —C(=S)S—,
- A is alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, heteroalkenyl, heteroalkynyl, heterocyclic and Ar—(CH₂)ₙ— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl and,
- B is rapamycin or derivative thereof, alkyl, alkenyl, alkynyl, cycloalkyl, heteroaryl, heteroalkenyl, heteroalkynyl, heterocyclic, and Ar—(CH₂)ₙ— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl,

wherein alkyl is a linear or branched saturated aliphatic hydrocarbon group, alkyl is a linear, branched or cyclic alkyl group containing at least one carbon—carbon double bond, alkenyl is a linear, branched or cyclic alkyl group containing at least one carbon—carbon triple bond, alkynyl is a cyclic saturated aliphatic hydrocarbon, heteroalkenyl is a linear or branched saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branched or cyclic alkyl group containing at least one carbon—carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heterocyclic is a cyclic saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon.
23. A pharmaceutical composition for treating a disease comprising a pharmaceutical carrier and an effective amount of a compound comprising the structure (I), (II), or (III) or a pharmaceutically acceptable salt thereof,

wherein:

the disease is organ and tissue transplant rejection, autoimmune disease, proliferative disorder, restenosis, cancer, or microbial infection,

R² is —C(=O)OR¹, —C(=S)OR¹, —C(=O)SR¹, or —C(=S)SR¹;

R¹ is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, or Ar—(CH₂)ₙ— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl, where at least one hydrogen of R¹ is replaced by a hydroxyl group, an amino group, a thio group, a phosphate group, a carboxyl group, a carbonate group, a sulfonate group, a sulfonamido group, a sulfamide group, or a combination thereof,

R⁰ is —C(=O)OR², —C(=S)OR², —C(=O)SR², or —C(=S)SR²;

R² is C₇-C₂₂ alkyl, C₇-C₂₂ alkenyl, C₇-C₂₂ alkynyl, C₅-C₁₂ cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, or an aromatic group,

wherein the aromatic group is naphthyl, biphenyl, anthryl, tetrahydroanthryl, phenanthryl, indane, tetracenyl, pentacenyl, triphenylenyl, imidazolyl, triazolyl, tetrazolyl, oxazolyl, isoxazolyl, thiazolyl, isothiazolyl, thiophenyl, pyrazinyl, pyrimidinyl, phenyl substituted with amine, phosphorus, phosphate, sulfonate, sulfonate, sulfonamide,

R⁰ and R⁴ are each independently —C(=O)O—, —C(=S)O—, —C(=O)S—, or —C(=S)S—.

A is alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, and Ar—(CH₂)ₙ— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl and,

B is rapamycin or derivative thereof, alkyl, alkenyl, alkynyl, cycloalkyl, heteroalkyl, heteroalkenyl, heteroalkynyl, heterocyclyl, and Ar—(CH₂)ₙ— where n is 0 to 12 and Ar is phenyl, substituted phenyl, aryl, heteroaryl, or substituted aryl,

wherein alkyl is a linear or branched saturated aliphatic hydrocarbon group, alkenyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond, alkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon triple bond, cycloalkyl is a cyclic saturated aliphatic hydrocarbon group, heteroalkyl is a linear or branched saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon, heteroalkenyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon double bond with at least one carbon atom being replaced by an atom other than carbon, heteroalkynyl is a linear, branched or cyclic alkyl group containing at least one carbon-carbon triple bond with at least one carbon atom being replaced by an atom other than carbon, heterocyclyl is a cyclic saturated aliphatic hydrocarbon group with at least one carbon atom being replaced by an atom other than carbon.

24. The compound of claim 1 wherein the compound is 42-O-[(4'-vinyl carbonate)but-1'-oxy carbonyl]rapamycin, 42-O-(cis-octadec-9'-enyl oxy carbonyl)rapamycin, 42-O-[(S)-2',3'-di hydroxy propoxy carbonyl]rapamycin, 42-O-(3'-hydroxypropoxy carbonyl) rapamycin, 42-O-[(4'-dodecyl carbonate)but-1'-oxy carbonyl]rapamycin.

25. The process of claim 3 wherein the compound is 42-O-[(4'-vinyl carbonate)but-1'-oxy carbonyl]rapamycin, 42-O-(cis-octadec-9'-enyl oxy carbonyl)rapamycin, 42-O-[(S)-2',3'-di hydroxy propoxy carbonyl]rapamycin, 42-O-(3'-hydroxypropoxy carbonyl) rapamycin, 42-O-[(4'-dodecyl carbonate)but-1'-oxy carbonyl]rapamycin.

27. The pharmaceutical composition of claim 23 wherein the compound is 42-O-[(4'-vinyl carbonate)but-1'-oxy carbonyl]rapamycin, 42-O-(cis-octadec-9'-enyl oxy carbonyl)rapamycin, 42-O-[(S)-2',3'-di hydroxy propoxy carbonyl]rapamycin, 42-O-(3'-hydroxypropoxy carbonyl) rapamycin, 42-O-[(4'-dodecyl carbonate)but-1'-oxy carbonyl]rapamycin.
