Table S2. Comparison of selected DFT calculated (polarizable continuum model, PCM-MeCN) bond lengths (Å) and angles (°) for **4**⁴⁺, **4**^{2(•+)} and **4** (for atom numbering see Table S1).

Note the strong variation in the C-N and C-C bond lengths in the heterocycle rings (**red entries**) for each of the sequential oxidation states of the macrocycle (**4**⁴⁺, **4**^{2(•+)} and **4**). In contrast, note the relative invariance with oxidation state of the bond lengths calculated in the polyaromatic spacer units (**purple entries**). The C-N bonds between the heterocycle rings and polyaromatic spacer units (**green entries**) also become shorter upon the reduction, which is ascribed to a better π -overlap between C(p) and N(p) orbitals due increasing planarity of the viologen units (Figure 6 in the main text).

| Bond | Bond Length (Å) | | |
|---------|------------------------|---------------------------|----------|
| | 4 ⁴⁺ | 4 ^{2(•+)} | 4 |
| N51-C3 | 1.442 | 1.424 | 1.403 |

| Mixed | 3.98 (312) | 0.024 |
| β -HOSO-12 \rightarrow β -LUSO (59) β -HOSO-11 \rightarrow β -LUSO+1 (59) | 3.99 (311) | 0.13 |
| β -HOSO-13 \rightarrow β -LUSO+1 (66) β -HOSO-14 \rightarrow β -LUSO (67) | 4.06 (305) | 0.090 |

Figure S1. Molecular orbitals of 4^{4+} involved in the calculated transition at 339 nm.

Figure S2. Molecular orbitals of $4^{2(\bullet+)}$ involved in the calculated transition at 584 nm.

Figure S3. Molecular orbitals of **4** involved in the calculated transition at 453 nm.

Figure S4. Calculated electronic absorption spectra for $4^{2(\bullet+)}$ with vertical excitations. (See Table S3 and Figures S5 and S6 for more details.)

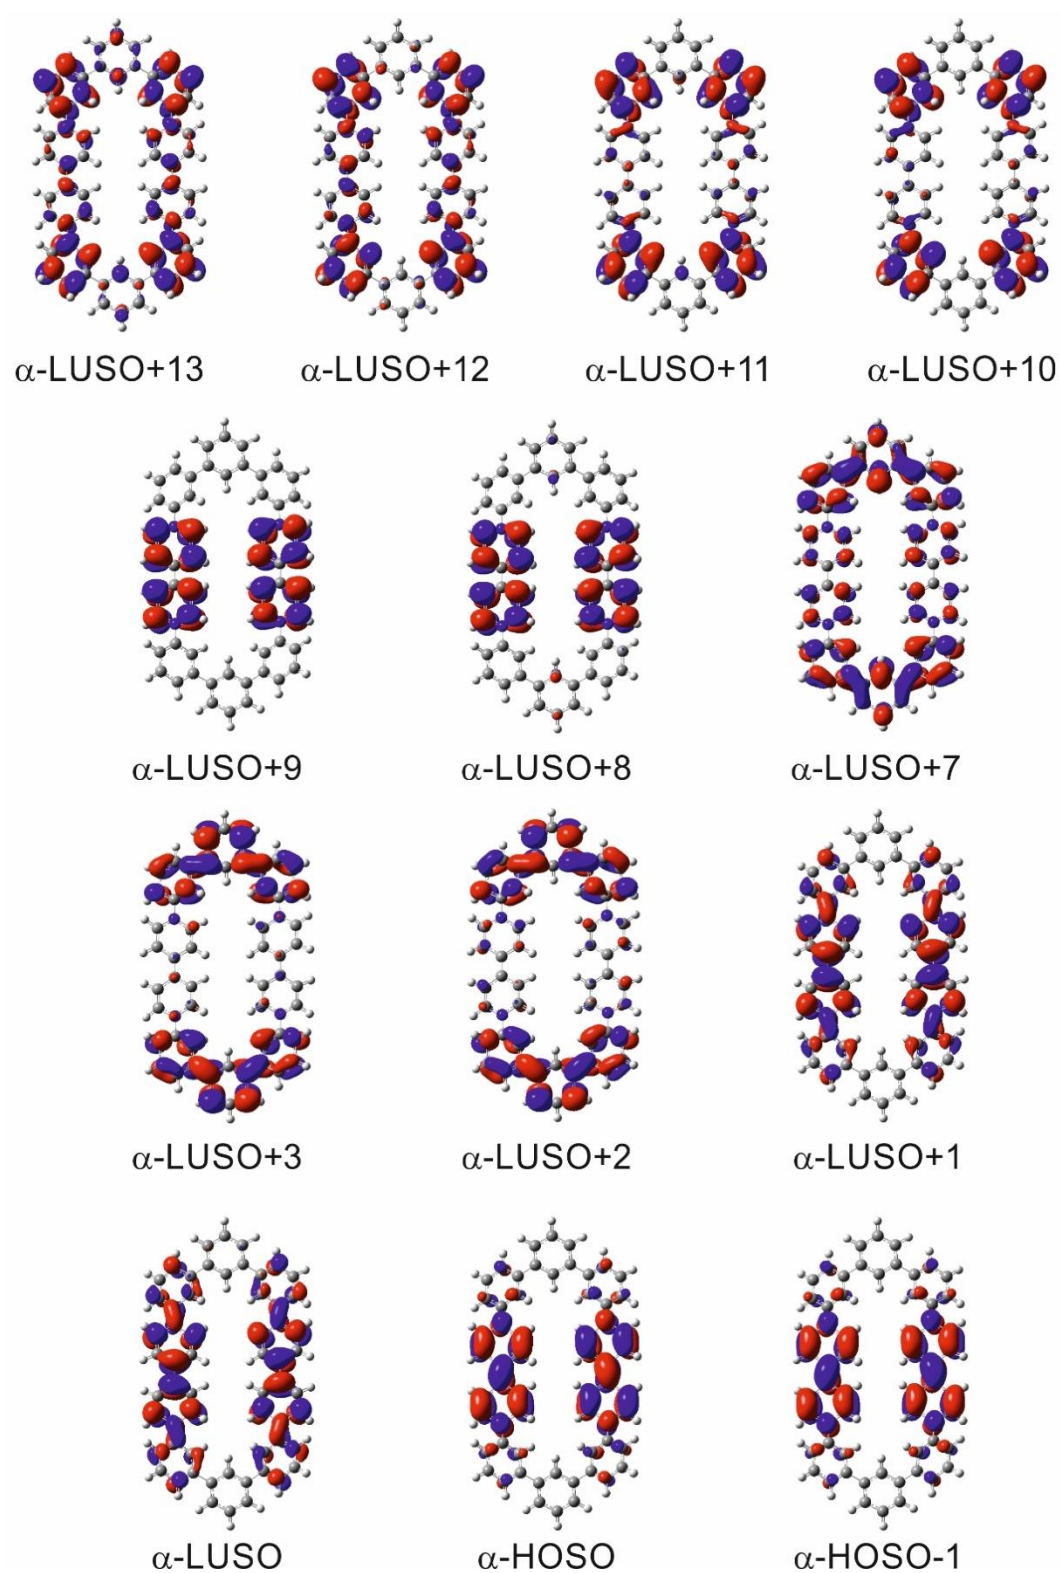

Figure S5. Calculated α -spinorbitals of $4^{2(++)}$ involved in the UV-vis electronic transitions (Table S3).

Figure S6. Calculated β -spinorbitals of $4^{2(\bullet+)}$ involved in the UV-vis electronic transitions (Table S3).

DOSY ^1H NMR data

Figure S7. Four DOSY spectra (CD_3CN) corresponding to samples of 1.3 mM $\mathbf{4}^{4+}$ and 0, 1.3, 2.6 and 13 mM **10** respectively (used to construct Figure 7 in the paper). Only the region between 8 and 10 ppm shown. In the sample containing 13 mM $\mathbf{4}^{4+}$, peaks at ca. 8.5 ppm are not included in analysis due to overlap of signals from both species. Purple line indicates estimate for diffusion coefficient of $\mathbf{4}^{4+}$ in the absence of any complexation.

^1H and ^{13}C NMR spectra of 4^{4+}

Figure S8. ^1H NMR $[(\text{CD}_3)_2\text{CO}, 400 \text{ MHz}]$ and ^{13}C NMR $(\text{CD}_3\text{CN}, 100 \text{ MHz})$ spectra of $4^{4+}.4(\text{PF}_6^-)$

Figure S9. 400 MHz ^1H and 100 MHz ^{13}C NMR spectra of **10** (CDCl₃)
