## 3-5-MAN CHESS DATA

*G.McC. Haworth<sup>1</sup>*

UK

### ABSTRACT

This reports the work of Karrer and Wirth in identifying percentage results and, respectively, the Depth to Mate (DTM) and Depth to Conversion (DTC) data in all 2-5-man chess endgames.

## 1. INTRODUCTION

Karrer (2000) mined Nalimov's endgame tables (EGTs) to produce a complete list of DTM maximals and statistics, wtm and btm. Wirth (2000) then computed the 4-1 EGTs to complete his 2-5-man DTC suite and to produce the analogous data for the DTC metric which was compared with Thompson's 'CD' data (2000).

Wirth (2000) also provided the results percentages, wtm and btm. As he also provided the number of positions won in a specific number of plies, quick wins based on shallow tactical devices may be discounted as required from these percentages. As Wirth eliminates from his EGTs duplicates of positions with two Kings on a long diagonal, his statistics are marginally more accurate than Nalimov's. Both, for reasons of comparability, discount only those unreachable positions where the side-not-to-move is in check. Most obvious among residual unreachables, White is credited with 77 unreachable KNNK wins in 1 move.

Tamplin (2001) provides an excellent query interface to these DTM and DTC EGTs, the latter via Lincke (2001) where even the 4-man tables are to the DTC metric. Here are some sidelights on Table 1's statistics.

- Independent maxDTM computations by Rasmussen (2000) agreed completely with Karrer's data.
- Thompson's 5-man EGTs maximise the DTC of the next position rather than postponing the next conversion to mate or a subgame: the weaker side is allowed to capture voluntarily as a human player might do. This produced different maxDTC data for KRKNP, KRRKN and KBNKP. Thompson (2001) now maximises the current DTC by maximising the number of men on the board first. Note that under DTC, the stronger side may unnaturally force-sacrifice surplus force, e.g., as in KQQQK.
- Wirth used the existing ETH(Zürich) software RETROENGINE which assumes that captures are made by the winner. Where this need not be so as in wKc3Rb4c2/bKa1, Wirth's depths in plies are 1 ply too great: the wtm maxDTCs for KQRKR and KRRKQ are therefore suspect. Similarly, Thompson (2001), e.g., with Ra4+ and Kd4/5/6 alongside Ra2+ for wKc5Rb4c2/bKa1Na7a8, can rate moves equi-optimal which differ in depth by one ply. It is unlikely that any player has incurred a 50-move draw on these grounds yet.
