Abstract

- The literature on the relationship between the degree of multinationality (M) and performance (P) in the context of multinational enterprises (MNEs) has attracted a large volume of scholarly research in the past 50 years. Yet, the conclusions concerning the nature of M-P relationship and the theoretical foundations vary greatly, thus call for a critical review and assessment.
- We adopt an original inter-disciplinary approach by integrating international business, finance, and accounting perspectives to provide a comprehensive and critical review of the literature. We examine 135 articles in 39 leading scholarly journals and classic books published during the period 1960-2015. We use an inductive approach and a qualitative content analysis methodology for our review.
- Our analysis shows that the literature has been built upon a wide variety of theoretical perspectives. The majority of previous studies predominantly examine the relationship between M and P. Thus, we review the theoretical conceptualization and measurement of M, P, the findings on M-P relationships, methodologies, and geographic focus. We identify six key inconsistencies in the existing research, which cause ambiguity in the relevant findings. We make eight recommendations for future research directions to

address these inconsistencies. Thus, our analysis contributes to the central debate in this research field.

Key words: multinationality (M); performance (P); M-P relationships; internalization theory; FSAs/CSAs framework; accounting perspectives (IAS38; IFRS8 and FASB131).

MULTINATIONALITY AND PERFORMANCE LITERATURE: A CRITICAL REVIEW AND FUTURE RESEARCH AGENDA

Introduction

The research on the relationship between the degree of multinationality (M) and performance (P) of the multinational enterprise (MNE) has generated an enormous number of studies in the international business (IB) literature in the past 50 years. The majority of previous studies focus predominantly on testing the effects of multinationality on firm performance, rather than examining the impact of internal factors of the firm and external business environments of home and host countries on its performance. Despite all efforts, this research stream is still the subject of endless debate due to the inconclusive empirical results with different functional forms and shapes, ranging from linear positive, negative, U-, inverted U-, J-, inverted J-, S-, inverted S-shaped and those with no relationship. Bove et al. (2010) maintain that prior research has failed to discover a consistently signed relationship. Glaum and Oesterle (2007) argue that the M-P debate has generated more questions than concrete answers. Unsurprisingly, a number of IB scholars have cast doubt on the valid theoretical rationale for such a generalizable M-P relationship (Dess et al., 1995; Hennart, 2007, 2011; Verbeke et al., 2009; Verbeke and Brugman, 2009; Verbeke and Forootan, 2012).

This literature has accelerated to a point whereby there are now meta-analysis studies (Bausch and Krist, 2007; Kirca et al., 2011; Kirca et al., 2012; Kirca et al., 2012; Palich et al., 2000; Yang and Driffeld, 2012); literature review studies (Annavarjula and Beldona, 2000; Cardinal et al., 2011; Hill et al., 2006; Li, 2007; Matysiak and Bausch, 2012; Oesterle and Richta, 2013; Ramaswamy, 1992; Sullivan, 1994a,b), and conceptual papers (Glaum and Oesterle, 2007; Hennart, 2007, 2011; Verbeke and Brugman, 2009; Contractor, 2007, 2012; Hult, 2011; Verbeke and Forootan, 2012).

The M-P relationship is among the key topics in the field of IB research. We believe that the time is ripe to conduct reviews, meta-analyses, and conceptual works, which help us to understand the achievements and limitations of the extant literature. It is important to identify generalizable relationships, to detect the contradictions and potential reasons in the empirical literature, and to provide suggestions incorporating both theory and methodology to advance the literature.

Our study differs from existing literature review articles in several major areas. First, we adopt an innovative and original inter-disciplinary approach by incorporating IB, finance theories and accounting perspectives in our work. We demonstrate the need for such an integrated approach in our critical literature review, in our analysis of theoretical concepts and measurements, as well as in our analysis of the empirical findings of the existing literature, and in our suggestions for future research. Thus, we provide a new fresh way of thinking about the old issues of the M-P literature. Our work is a timely response to calls by finance scholars to integrate contemporary finance into IB research (Agmon, 2006; Bove et al., 2010; Oxelheim et al., 2001, 2012), because such an inter-disciplinary approach will enrich the literature.

Second, we examine 135 articles in 39 leading journals and classic books published between 1960 and 2015, which have been identified from numerous disciplines and the fields of international business, strategic management, finance, financial economics, international management, financial management and accounting, and marketing. We aim to consolidate previous research findings, and to provide an overall picture across these domains and disciplines, because there is a lack of integration of the existing literature in these related fields (Kirca et al., 2012). We use an inductive approach and conduct a qualitative content analysis, which has been recognized in management research as a research tool for integrating and expanding the bases of knowledge on a specific research topic (Douriau et al,

2007). This approach enables researchers to analyze the contents of the literature through careful procedures, such as examining data sources, identifying research themes, and leads to suggestions for methodological refinements. Qualitative content analysis is also well suited to contributing to the development of theory and for synthesizing empirical research over a variety of disciplines and studies. Overall, our study advances previous qualitative literature review papers (Annavarjula and Beldona, 2000; Hitt et al., 2006; Li, 2007; Cardinal et al., 2011; Matysiak and Bausch, 2012; Oesterle and Richta, 2013), which are based on smaller samples focus on a narrower, more limited set of issues.

Third, we not only present the state of the art M-P literature but also provide a critical evaluation, in which we identify six key inconsistencies in the existing literature. We discuss the essential results and findings of our review. Specifically, we find that previous studies use a wide variety of theories, or multiple theories to advocate for a particular model. The inconsistencies are also found in the theoretical conceptualization and measurements of M, P and M-P relationships, an omission of risk-return trade-off, a deficiency of diversity in geographic focus (i.e. the majority of studies use the United States firm datasets), and a lack of cross-country analysis and comparative studies. To clearly demonstrate our findings from a critical literature review, we have prepared an in-depth analysis of 50 representative articles including dependent, independent, control and moderating variables (if any), sample size, statistical techniques, and findings with different functional forms and shapes. Due to space constraints, they are not presented here.

Finally, we provide eight practical and solution-focused suggestions for new directions of future research after we present our thorough review of previous meta-analysis, literature review and conceptual papers. Our recommendations are theoretically rigorous and empirically testable. Specifically, we recommend that future research focus on the inter-relationship between firm-specific advantages (FSAs) and performance, i.e. that FSAs are the

key driver of a firm's performance. A proportion of profits are then retained (retained earnings) to finance reinvestment in the continuous development, creation and generation of FSAs. This assures the sustainable expansion and growth of the firm. We suggest that researchers consider applying international accounting standards, such as IFRS8-*Operating Segments* and the US GAAP FASB 131-*Disclosures about Segments of an Enterprise and Related Information* to examine the relationship between geographic segments and performance. This is strongly related to the literature of regional strategy and the performance of the MNE and its foreign subsidiaries (Rugman and Verbeke, 2004; Rugman, 2000, 2005; Oh & Rugman, 2014; Nguyen, 2014, 2015a). In addition, we suggest that it is particularly important to isolate the effects of the performance of home country operations from international operations by examining the return on home assets (ROHA) and the return on foreign assets (ROFA) separately. This approach advances the current literature, which focuses on examining the relationship between the degree of multinationality and the return on total assets (ROTA). We recommend that future research considers using alternative measures of value-based performance and incorporates finance factors in the research design. We also emphasize the need for diverse research settings, with research conducted in other countries than the United States, as well as the need for comparative studies. Finally, future research might examine this phenomenon from a lower unit of analysis by using a subsidiary-level perspective.

Focus of the Study

We examine what and how theoretical concepts and approaches have been applied to explain the phenomenon of the M-P relationship as we attempt to analyze the main results and inconsistencies in the existing literature. To achieve this objective, we critically assess publications on this research stream in top journals and classic books. We aim at answering three closely interrelated questions:

1. How does the existing literature conceptualize the M-P relationship?
2. What inconsistencies in this literature can be identified?
3. How can we advance our knowledge in this research stream?

Methodology

In order to address our research questions, we use an inductive approach and a qualitative content analysis (Durlauf et al, 2007). This methodology has been adopted in previous literature review studies by Jormanainen and Koveshnikov (2012), and Stahl and Tung (2015). Such an approach allows us to focus on investigating how this phenomenon has been addressed in top journals and classic books, how the topic has been examined, and what are the main findings to date. We follow the suggestions by Durlauf et al. (2007). Our research design consists of several methodological steps taken in a systematic manner to ensure the reliability of the analysis. This enables us to use clear definitions of the concepts, research area, database for analysis, selection of texts to be analyzed and interpretation of the results (Durlauf et al. 2007; Jormanainen and Koveshnikov, 2012).

Research Area and Selection of Database and Journals

We follow Durlauf et al (2007) and Kirca et al. (2011) in our methodological approach to define the database for the analysis, i.e. which database and which journals to select for reviewing. In the first stage, we use the database of Business Source Complete by EBSCO Industries, Inc. to search for articles. This is one of the most comprehensive databases covering full-text articles in scholarly journals and books. In the second stage, we proceed by carefully examining articles issue-by-issue in leading journals in the fields of IB, general management, strategic management, marketing, economics, finance, financial economics, financial management and accounting. These include *Journal of International Business Studies (JIBS)*, *Strategic Management Journal (SMJ)*, *Academy of Management Journal*, *Management International Review (MIR)*, *International Business Review (IBR)*, *Journal of*

Business Research (JBR), Journal of World Business (JWB), Multinational Business Review (MBR), Global Strategy Journal (GSJ), British Journal of Management, Journal of Management, Journal of International Management, Asia Pacific Management Journal, Journal of Finance, Corporate Finance Review, Journal of Financial and Quantitative Analysis, European Journal of Management, and others. These journals are recognized as top publications with high impact factors by the ISI Web of knowledge database and Association Business School Journal Quality Guide. In the third stage, we examine reference sections of all previous major meta-analysis and literature review articles which have been published on the topic. This careful procedure ensures to identify any studies which we might have overlooked in the previous two stages (Kirca et al., 2011).

Selection of Text for Analysis

The next step of the methodological procedure is to select articles and books to be reviewed. We decide to include only published full-length research articles and classic books. We exclude unpublished thesis, dissertations, and working papers. The reason we include only published studies is that they are subject to a rigorous peer-review process (Jormanainen and Koveshnikov, 2012). Furthermore, future research can refer to these articles from our reference list, as they are publicly available unlike unpublished works. Our selection approach here is consistent with previous studies by Duriau et al. (2007), Jormanainen and Koveshnikov (2012) and Stahl and Tung (2015). However, it is slightly different from Kirca et al. (2011), which includes both published and unpublished studies. The period of selected publication covers from 1960 with the first publication by Hymer (1960) to 2015 (inclusive). Our intention is to provide a comprehensive overview of the literature covering important contributions to the field.

To select articles from the database and journals, we have chosen a number of key words in line with our specific focus on the M-P relationship in the context of the MNE. We focus on

MNEs only as they expand internationally by establishing a network of foreign subsidiaries (i.e. engaging in foreign direct investment (FDI) activities) rather than exporting or licensing (Buckley and Casson, 1976; Hennart, 1982; Rugman, 1981). We exclude articles on the relationship between internationalization (I) and performance (P) by exporting of small and medium sized enterprises (SMEs), foreign market involvement by exporting of born-global firms and international new ventures (INVs), and the internationalization of top management teams (TMT), as these topics belong to other research streams.

Our approach of article selection differs from most previous literature reviews, meta-analysis, and conceptual articles, as these include studies of SMEs, MNEs, INVs, and TMT. In the internationalization process, SMEs see exporting as offering potential extra sales and may use a local agent or distributor, or may choose to export directly to a particular foreign market. However, the depth of SMEs' involvement and their resource commitment to expand to foreign markets by exporting is low relative to MNEs with value-adding FDI activities, except for those subsidiaries located in tax havens. From the perspective of internalization theory, MNEs must carefully weigh firm-specific advantages (FSAs) and home and host country-specific advantages (CSAs) in their strategic decisions about foreign market involvement (Rugman, 1981; Rugman & Collinson, 2012).

We provide a clear definition of an MNE. This helps conceptually justify our selection of articles for this review. An MNE is defined as a company headquartered in one country, but having operations in other countries (Rugman, 1981). Specifically, an MNE must have the ratio of foreign sales to total sales (FS/TS) of at least 10 percent and three foreign subsidiaries (Rugman, 1981). The threshold of FS/TS at 10 percent comes from the international accounting standards, such as IFRS8-*Operating Segments* and the US GAAP FASB 131-*Disclosures about Segments of an Enterprise and Related Information*.

The list of key search terms consists of references to the performance implications of international activities of the MNE. The search terms for multinationality include *degree of multinationality*, *multinationality*, *degree of internationalization*, *internationalization*, *international expansion*, *international diversification*, *global diversification*, *geographic diversification*, and *international market diversification*. The literature tends to use these concepts interchangeably, although they are not synonymous (Verbeke and Brugman, 2009).

The search terms for firm performance include *return on assets (ROA)*, *return on equity (ROE)*, *return on sales (ROS)*, *Tobin's q*, *shareholder value*, *total shareholder return*, *sales growth*, *firm growth*, *risk adjusted return*, *scale efficiency*, *excess q*, *Jensen's alpha*, *Sharpe*, *Jensen and Treynor's measures*, *abnormal returns*, *excess value*, *market value*, *economic value added (EVA)*, and *cash flow return on investment (CFROI)*.

With these lists of key search terms in mind, we go through all the articles shown in the database and journals. We read these articles carefully, in which we examine title, abstract, key words, introduction, conclusion, and journal outlets. We include both conceptual, empirical, literature review, and meta-analysis articles. The process identifies 128 articles in 39 leading journals, and seven (7) classic books, which makes a total sample of 135 studies. Table 1 presents our findings on the distribution of publication outlets.

Table 1

Table 2 reports the types of articles. These include 11 conceptual articles, 102 empirical articles, seven conceptual articles, nine literature reviews, and six meta-analysis articles.

Table 2

Analysis

We analyze these articles qualitatively (Welch et al, 2011). First, we focus on the manifest content of each article (Suddaby and Greenwood, 2005; Jormanainen and Koveshnikov, 2012). We read full contents of all these studies carefully and then we document them in an

excel spreadsheet (Jormanainen and Koveshnikov, 2012). The information includes name of authors, year of publication, journals, theoretical perspectives, concepts and measurements, methodology in terms of data sources and geographic focus, control and moderating variables, key findings, and suggestions for future research proposed by these authors. We discussed our research process with an international business scholar with great expertise in this process and in the relevant literature.

Second, we analyze the latent content of each article (Suddaby and Greenwood, 2005) to ensure its direct contribution to the M-P relationship literature, and the core concepts (M and P) and relationships used to operationalize contributions (M has a linear positive/negative/no/U-, inverted U-, J-, inverted J-, S- and inverted S-shaped performance implications). We read and code main points of the articles, theoretical perspectives, and conclusions.

Third, we analyze the content of the selected studies to outline what and how theoretical concepts and approaches have been developed. We examine the contributions in the existing literature in terms of consistency and validity, and summarize the results of our analysis in a framework (Figure 1).

Figure 1

Findings and Discussion

Inconsistency 1: Theoretical foundations and overall empirical results

Our analysis from the critical literature review shows that the literature has adopted a wide range of theoretical perspectives to advocate for a particular M-P relationship. These include internalization theory (Buckley and Casson, 1976; Hennart, 1982; Rugman, 1981); Dunning's eclectic paradigm (Dunning, 1985); the resource-based view of the firm (Wernerfelt, 1984; Barney, 1991; Teece, 1986; Teece et al., 1997); portfolio and diversification theory (Rugman, 1976); liability of internationalization (Hymer, 1960; Zaheer, 1995; Eden and Miller, 2001);

incremental internationalization process and experiential learning (Johanson and Vahlne, 1977); and organizational evolution and organizational learning (Chandler, 1962; Tushman and Romanelli, 1985; Sullivan, 1994a,b; Contractor et al., 2003; Lu and Beamish, 2004).

In addition, we find that a number of studies (Hitt et al., 2006; Contractor et al., 2003; Lu & Beamish, 2004) use arguments from multiple theoretical perspectives to develop their conceptual models and hypotheses. However, Kirca et al., (2011) argue that this approach has created more ambiguity than clarification, as it becomes difficult to link the results from such an approach back to the confirmation, extension, or refutation of any particular theory.

In a related manner, empirical results vary greatly with different types of relationships. In subsequent sections, we provide a detailed review of the concepts and measurements of M, P and empirical results on the M-P relationships. We discuss our findings analytically, and offer potentially plausible explanations of several inconsistencies in the conceptualization and measurement, which may cause mixed empirical results. We also identify some limitations in methodology (geographic focus and testing techniques).

Our Analysis on Theoretical Foundation and Overall Empirical Findings

An important element of our critical literature review is to identify the limitations of underlying assumptions, the inherent weaknesses of theoretical conceptualization, and measurements in the current literature. First, the major limitation of the M-P literature is the inability of researchers to ascertain to what extent multinationality leads to performance or performance leads to multinationality (Bowen, 2007; Verbeke and Brugman, 2009). All extant studies mainly examine one-way direction of causality of the effects of multinationality on firm performance. There is no study which examines the potential reverse effects of performance on multinationality. On the other hand, Jung & Bansal (2009) test the relative performance on internationalization based on a behavioral perspective. They argue that management's decision to expand internationally may be made based on perceived firm

performance. This is defined as firm performance relative to benchmarks by comparing it to its historical performance or its industry. However, they suggest that the perception of managers, which is susceptible to cognitive biases, plays a key role in firm internationalization and the availability of resources. One of their findings is that the stronger a firm performs relative to industry targets, the more likely it is that the firm expands internationally.

Second, another limitation of the literature is that prior research does not show a clear analysis of a firm's performance in its home country and international operations from its network of foreign subsidiaries, excepting Gestrin et al., (1998), Rugman et al., (2008), and Fisch and Zschoche (2011a, b). In other words, the underlying assumptions of the effects of multinationality on performance, which specify that a firm can achieve similar or greater profits in their foreign operations than in their home country, which justifies internationalization has not been substantiated convincingly in the majority of previous studies.

Third, we find that the number of empirical studies testing the relationship between FSAs and firm performance is much smaller than the large number of studies testing the M-P relationship. The studies by Rugman (1981), Morck and Yeung (1991), Rugman et al., (1985), Kirca et al. (2011), and Lee et al. (2015) are these few ones with a clear focus on FSAs as determinants of firm performance. The FSAs are the strengths or benefits specific to a firm as a result of contributions by its technology, brand, trademark, marketing, and managerial capabilities relative to its rivals (Rugman, 1981). Given that FSAs are prerequisites for a firm's internationalization and thus performance, this finding is puzzling.

Inconsistency 2: Conceptualization and Measurements of Multinationality (M)

According to Hennart (2011), multinationality refers to a firm's expansion beyond its domestic market into foreign countries. The degree of multinationality (M) is measured by a

wide variety of constructs (Annavarjula and Beldona, 2000; Li, 2007, Hennart, 2011; Aggarwal et al., 2011), and multi-dimensional constructs (Sullivan 1994a, b). The most commonly used proxies include:

- (a) Foreign market penetration: defined as the level of a firm's dependence on foreign markets (Hennart, 2011) as measured by the ratio of foreign sales to total sales (FS/TS) (Li, 2007; Hennart, 2011).
- (b) Foreign production presence: defined as the degree to which a firm produces goods and services abroad (Hennart, 2011), as measured by the ratio of foreign assets to total assets (FA/TA), or the proportion of overseas subsidiaries to total subsidiaries (OS/TS), or foreign employees to total employees (FE/TE) (Kim et al., 1989).
- (c) Foreign sales dispersion: defined as the dispersion of foreign sales based on segment data (Hennart, 2011).
- (d) Country scope: defined as the number of foreign countries in which the firm operates (Hennart, 2011), as measured by a count-based number of foreign countries.
- (e) Diversity of foreign countries entered: which is related to the external environment of cultural and institutional diversity (de Jong and van Houten, 2014).
- (f) Attitudinal attributes: defined as top management's international experience and/or orientation (TMIO) (Sullivan, 1994a, b).

The measurements of multinationality can be broadly grouped into scale metrics (FS/TS, FA/TA, and FE/TE), and scope metrics (count-based number of foreign subsidiaries, and number of operating countries) (Rugman and Oh, 2011). The FS/TS ratio is the most frequently used proxy to measure the degree of multinationality (M), because it is the basic metric showing the degree of foreign involvement. However, the FS/TS ratio, especially those studies using the Compustat database, suffers from one problem: this ratio includes

exports by parent firms in home countries as well as sales by foreign subsidiaries in host countries (Hennart, 2011; Rugman and Oh, 2011; Wiersema and Bowen, 2011).

A number of studies have used sales-based entropy indices (Hitt et al., 1997; Kim, et al., 1989), multiple indicators (Tallman and Li, 1996), and a composite index of two or three indicators (Contractor et al., 2003; Li and Qian, 2005; Lu and Beamish, 2004; Lee et al., 2015) to refine the measurement of multinationality. The ratio FA/TA has not been frequently used (Geringer et al., 1989; Marthur et al., 2001). Daniels and Bracker (1989), Marthur et al., (2001), and Lee et al. (2015) use asset and sales coverage to measure multinationality.

Ramaswamy (1995), Tallman and Li (1996), and Yang et al. (2013) use a configuration measure of multinationality based on country scope. Michel and Shaked (1986) use count-based measures of number of foreign subsidiaries, and number of countries alongside international sales. Lu and Beamish (2004) use both country and subsidiary count, whereas Kim et al. (1989) employ a ratio of foreign employees to total employees (FE/TE).

Sullivan (1994a, b) introduces the degree of internationalization composite index (DOI), comprising the ratio of FS/TS, FA/TA, OS/TS, top management's international experience (TMIE), and psychic dispersion of international operation (PDIO), which is a cultural variable discussed by Kogut and Singh (1988). The degree of internationalization is computed as follows: $DOI = FSTS + FATA + TMIE + PDIO$ (Sullivan, 1994a). However, Ramaswamy et al. (1996) question the content validity of Sullivan's index (1994a). Rugman and Oh (2011) argue that Sullivan's (1994a) composite index of multinationality is simplistic, as it just adds together scale and scope metrics and confuses rather than clarifying matters.

The cultural variable (psychic dispersion of international operation) in Sullivan's composite suffers from an inherent limitation, as it is related to ten theoretical problems in cross-cultural research identified by Shenkar (2001). The cultural composites by Hofstede (1983) and Kogut and Singh (1988) are among the most frequently used metrics in culture studies.

However, the debate is still ongoing as to what constitutes culture, whether and how it could be measured, what is related, and what is relevant (McSweeney, 2002).

Tung and Verbeke (2010) advocate improving the quality of cross-cultural research beyond Hofstede and GLOBE (House et al., 2004; Hofstede, 2006). Hutzschenreuter and Voll (2008), and Hutzschenreuter et al., (2011) show that the measurements of macro-level distance, for example, in the cultural sphere, between home and host countries may be sometimes completely irrelevant. In the case of established MNEs, it is the additional distance that matters. The additional distance is the cultural distance between a newly entered host country and the country where the MNE is already established that exhibits the smallest distance with this new host country (see Verbeke and Brugman, 2009).

Verbeke and Brugman (2009) argue that there is an important difference between the degree of internationalization (DI) and the degree of international diversification (DID). The DI is related to the degree of the firm's international expansion, whereas the DID is related to the firm's geographic dispersion, which is affected by cultural and institutional environment diversity. These scholars suggest that activities in different host countries face idiosyncratic challenges, both in terms of external opportunities and threats, and the firm-level capability to profitably transfer, deploy and exploit the MNE's firm-specific advantages (FSAs). Verbeke and Brugman (2009) find that some studies have incorporated this distinction (Qian and Li, 2002; Goerzen and Beamish, 2003). Goerzen and Beamish (2003) suggest that the international asset dispersion and country environment diversity as two distinct dimensions of multinationality. Contractor et al. (2003) count the number of subsidiaries but do not determine how this measure is related to the number of countries. Lu and Beamish (2004) recognize the issue but do not present a diversification measure.

Yet, Rugman and Oh (2011) criticize the count-based scope metric of number of foreign countries because it provides simplistic and potentially misleading information about the

foreign involvement of the firm. Rugman and Oh (2011) show that if a firm operates in one hundred countries, it would seem to be more multinational than a firm operating in two countries. However, if this is the case of a Canadian firm operating in a single large neighboring market, i.e. the United States, this firm is likely to have more foreign sales than another Canadian firm with operations in all other countries outside of the United States. Rugman and Oh (2011) maintain that the twenty largest Canadian firms generate on average about 80 percent of their foreign sales in the United States, with the remainder in rest of the world combined.

Rugman and Oh (2011) highlight a problem in the use of the scope measure. Basically, such a measure counts each country equally. Yet, for almost any firm, sales in a large market, such as the United States, Japan, Germany, and the UK will be of much greater significance than sales in smaller markets such as Jamaica, Luxemburg, and Kazakhstan. In other words, selling in a large number of small countries does not indicate that the firm is more multinational (see Rugman and Oh, 2011).

In addition, Hennart (2011) sharply criticizes the operationalization and the measurements of the degree of multinationality (M) as it does not match the theoretical arguments it has advanced. Hennart (2011) argues that the measurements of the degree of multinationality cannot be used to test arguments in the M-P literature, such as the ability to exploit intangibles, the ability to arbitrage, and external and internal costs of foreignness.

Our Analysis on Conceptualization and Measurements of Multinationality

One of the potential limitations of the variables of FA/TA, OS/TS, and FE/TE as proxies for international production is that they are not necessarily indicators of production activities. The FDI activities of MNEs could be focused on either distribution or R&D only, without production activities. In addition, the count-based measures of the number of foreign subsidiaries and the number of host countries as proxies for the breadth or dispersion of

internationalization have shortcomings. Specifically, they do not take into account the nature of foreign subsidiaries, whether or not they are really engaged in value-creating activities in accordance with Dunning's four FDI motives of market-seeking, efficiency-seeking, natural resource-seeking and strategic asset-seeking (Dunning, 1998). They might be purely offshore financial centres, special purpose entities, or holding companies without any substantive economic and productive substance (UNCTAD, 2013).

In business reality, a number of foreign subsidiaries are established as offshoring financial centres (OFCs) to channel funds to and from third countries. They are located in countries, territories and jurisdictions with relatively low or no tax (a type of tax haven). For example, the top three destinations of FDI flows from the Russian Federation, which are Cyprus, the Netherlands and the British Virgin Islands, coincide with the top three investors in the Russian Federation. Such flows are more akin to domestic investments disguised as FDI. In other words, the bulk of inflows in OFCs consist of FDI in transit which is redirected to other countries (UNCTAD, 2013).

In a related manner, another type of offshore finance mechanism is special purpose entities (SPEs). SPEs are foreign affiliates which are established for a specific purpose (e.g. administration, management of foreign exchange, facilitation of financing of investment) or specific structure (e.g. holding companies). They tend to be established in low-tax countries which provide specific tax benefits for SPEs. They may not conduct any economic activity of their own and have very few employees. Luxembourg, the Netherlands, Hungary, Cyprus, Switzerland, Ireland, Portugal, Denmark, Mauritius, the British Virgin Islands, Cayman Islands, Bermuda and other low-tax jurisdictions are popular locations for SPEs (UNCTAD, 2013; Base Erosion and Profit Shifting, OECD, 2014). For example, Mauritius has concluded a double-taxation treaty with India and has attracted foreign firms, especially those owned by non-resident Indians, which establish holding companies in Mauritius to invest in India

(UNCTAD, 2013). As a conduit for SPE FDI, Mauritius has become one of the largest FDI sources for India (UNCTAD, 2013).

Both OFCs and SPEs are created for tax benefit purposes rather than for value-creating activities (UNCTAD, 2013). For example, UK government has recently conducted inquiries into the UK operations of Google, Amazon, and Starbucks, which are all said to minimize their tax payments in the UK (The UK Parliament, Public Accounts Committee, 2012). Google runs its operations from Ireland; Amazon from Luxembourg; and Starbucks from the Netherlands. The three MNEs declare their profits consolidated across EU operations at the regional head offices, which are located in low-tax jurisdictions or tax havens (Rugman, 2013). In reality, the UNCTAD World Investment Report excludes OFCs and SPEs in reporting FDI flow data (UNCTAD, 2013).

We suggest that future research examine firms' annual reports, disclosure notes, and websites to collect information and a description of the nature of foreign operations rather than just rely on data extracted from large databases. The effects of these types of OFCs and SPEs should be controlled in future research design. Our suggestions here are consistent with Oesterle and Wolf (2011, page 21), who point out that "data from large databases usually do not paraphrase internal managerial aspects—and especially not the parameters controllable by managers—but, in most cases, only "surface characteristics" of the business firms".

Furthermore, we draw upon the accounting perspective to argue that the scale and spread of multinationality (M) can only be justified if it adds value to the firm through increased economies of scale and scope, and operational efficiency. If MNEs become too complex, the resulting problems of financial control and managerial motivation outweigh the advantages of larger size.

Inconsistency 3: Conceptualization and Measurements of Firm Performance (P)

The firm's performance measurements are widely varied and different among studies (Li, 2007). The choice of performance measures is difficult and discretionary (Venkatraman and Ramanujam, 1986; Hult et al., 2008). The empirical literature has used both accounting-based and capital market-based performance measures. Each approach is associated with specific problems (Verbeke and Brugman, 2009). The most frequently used performance measures are as follows:

(a) Accounting-based performance indicators: return on total assets (ROTA=consolidated profit to total assets) (Grant, 1987; Grant et al., 1988; Lu and Beamish, 2004; Ruigrok et al., 2007; Contractor et al., 2007); return on total sales (ROTS=consolidated profit to total sales) (Tallman and Li, 1996; Delios and Beamish, 1999; Geringer et al., 2000; Capar and Kotabe, 2003; Contractor et al., 2007; Yang et al., 2013); return on equity (ROE=net profit after tax to owner's equity) (Qian, 1998; Rugman et al., 1985; Rugman, 1981; Thomas and Eden, 2004; Contractor et al., 2007; Fisch and Zschoche, 2011a).

(b) Operational performance indicators: sales growth (Grant, 1987; Zahra et al., 2000), market share, and product quality (Venkatraman and Ramanujam, 1986).

(c) Cost-efficiency indicators: the ratio of operating costs to sales (Gomes and Ramawasmy, 1999; Ruigrok and Wagner, 2003).

(d) Capital market-based indicators: Tobin's q, i.e. a ratio defined by market value of assets divided by their book value (Lu and Beamish, 2004; Whited, 2001; Rugman and Oh, 2010; Lee et al., 2015); risk adjusted return (Michel and Shaked, 1986; Buehner, 1987).

Verbeke and Brugman (2009) argue that Tobin's q is an inadequate performance measure as its underlying assumption is that markets are efficient, i.e. a firm's true value is accurately reflected in its market valuation. Verbeke and Brugman (2009) point out that in reality other parameters often appear to determine market valuation (Shiller, 2000), as demonstrated by the collapse of the world stock markets in 2007-2008. Verbeke and Brugman (2009) maintain

that market performance may be a poor proxy of “true” performance, and that the difference between accounting and market-based performance measures may be idiosyncratic for each firm.

Our Analysis on Performance Measurements

We use the perspectives of accounting and value-based management to discuss the limitations of accounting-based performance measurements. They have shortcomings due to the possible managerial manipulation with profitability and changes in accounting systems (Morck and Yeung, 2009). They are retrospective in nature and they are unable to capture the MNE strategy manifested in its expected future profitability. They are generally poor measures of economic value added (EVA) (which is similar to the concept of economic profits by Severn and Laurence, 1974).

Furthermore, accounting conceptualization is a matter of concern. One of the main criticisms is related to the international accounting standard IAS38 *Intangible assets*, which deals with intangible assets, and R&D expenditure (IAS38). “Intangible asset” is defined “as non-monetary identifiable asset without physical substance. An asset is a resource that is controlled by the entity as the result of past purchase or self-creation and from which future economic benefits (inflows of cash and other assets) are expected” (IAS38). Examples of intangible assets are patented technology, trademarks, trade secrets, software, databases, internet domains, video and audio materials, customer base, licensing, royalty and standstill agreements, franchise agreements, and marketing rights (IAS38).

IAS38 requires an entity to recognize an intangible asset, whether purchased or self-created (at cost) if, and only if it is probable that the future economic benefits that are attributable to the asset will flow to the entity, and the cost of the asset can be measured reliably. This requirement applies whether an intangible asset is acquired externally or generated internally. The probability of future economic benefits must be based on reasonable assumptions about

the conditions that will exist over the life of the asset. The probability recognition criterion is always considered to be satisfied for intangible assets that are acquired separately or in a business combination (IAS38).

Spending on research (R) does not meet the criteria of deferral under IAS38, so it is expensed as incurred. Development (D) costs are capitalized only after the technical and commercial feasibility of the asset for sale or use has been established, otherwise it is expensed (IAS38).

Expertise is part of inherent corporate reputation, but as it cannot be valued reliably in a monetary amount, it is not recognized as an intangible asset in the balance sheet. Thus, a firm's R&D and marketing activities reduce accounting-based profit, rather than increase them. This makes comparisons difficult between firms which invest substantially in R&D and marketing, and those which do not.

We find that in the extant M-P literature, parent-level R&D and marketing expenses over total sales are the two most frequently used proxies for firm-specific assets (Kirca et al., 2011). They are actually expenses, and thus decrease accounting-based profit. Alternatively, if R&D and marketing costs are considered as important inputs for the creation of outputs of patented technology and trademarks, etc. (which are true intangible assets by accounting definition), they should be adjusted in the economic profit (EVA), which is a more appropriate performance measure of the firm. However, none of the previous M-P empirical studies, meta-analysis, literature review and conceptual papers has considered these particularly important matters.

Indeed, there are arguments in the accounting literature that the traditional financial reporting model is inadequate for dealing with knowledge-based firms. It is possible that capital markets might undervalue the firm because the financial statements do not reflect the true effect of the firm's R&D activities. Consequently, management of the firm often provides an overview of its previous year's operations and how the firm has fared in that time period.

Management usually outlines its future strategy, goals, and directions for new projects in the section of management discussion analysis of the annual report. However, it should be noted that this document is not audited.

From the perspective of value-based management, there are two problems relating to accounting profit or loss (Martin and Petty, 2007; Ryan, 2011). First, accounting profit ignores the cost of equity capital. The computation of profit or loss only takes into account the cost of debt finance in the form of interest expense, which is tax deductible. However, the firm only generates wealth when it generates a return in excess of the return required by both equity and debt capital providers. Second, profits which are reported in accordance with accounting standards do not truly reflect the wealth which has been created (Martin and Petty, 2007; Ryan, 2011).

We find that none of the previous M-P empirical studies use EVA as a performance measure, probably because EVA data are not available in any large databases. The EVA measure can be computed in accordance with standard methods of adjusting accounting data, which will be discussed subsequently in our suggestion for future research.

On the other hand, despite the inherent limitations of accounting-based performance measurements, they are valid indicators when empirical studies attempt to measure the effectiveness of R&D expenditure and other intangible assets on firm performance. Furthermore, there might be differences between accounting-based and market-based performance measures concerning their time-dependent sensitivity and time-dependent effectiveness in exploiting FSAs. It is necessary to take a time-lag into account before the FSAs effects can be realized on the performance of the firm.

Finally, the criticisms by Verbeke & Brugman (2009) on Tobin's q as a poor performance indicator in the case of shock events (e.g. financial crisis, etc.) can be addressed using statistical techniques. Specifically, future research is suggested to control for such effects by

including dummy years. Another alternative solution is to exclude explicitly such years of crises from the investigated sample period.

Inconsistency 4: Findings on the M-P Relationships

Positive Linear Relationship

A number of studies provide empirical evidence to support the benefits of international expansion as argued by internalization theory, Dunning's eclectic paradigm, and the resource-based view of the firm (RBV). Previous studies find that a firm's performance is positively correlated with the degree of internationalization (Vernon, 1971; Benvignati, 1987; Grant, 1987; Grant et al., 1988; Daniels and Brackers, 1989; Annavarjula et al., 2005; Rugman et al., 2008; Lee et al., 2015).

There are several reasons why increased multinationality should be linked to firm performance. These include maximizing its FSAs internally across borders (Rugman, 1981); risk reduction by international diversification (Rugman, 1976); benefits from economies of scale and scope (Buckley and Casson, 1979; Caves, 1996); reducing the impacts of domestic fluctuations by using foreign market outlets; taking advantage of factor cost differentials, and different tax regimes across multiple locations (Porter 1990; Jung, 1991; Contractor, 2012). Having multiple plants across several nations is said to increase profitability because it confers greater operational flexibility to shift production as factor costs, exchange rates or the business environment changes (Fisch and Zschoche, 2011b). Spreading common and central overheads over more and more nations, especially in R&D intensive industries (Kobrin, 1991; Tallman and Li, 1996; Contractor, 2012) is also likely to affect firm performance.

Rugman (1981) provides empirical evidence in which FSAs are important determinants of a firm's strategy and performance in accordance with the predictions of internalization theory. Similarly, Morck and Yeung (1991) find that the impact of spending on R&D and advertising on market value increases with a firm's multinational scale, but that multinationality per se

does not have any significant impact. Their results support internalization theory, which holds that intangible assets are necessary for FDI.

Lee et al. (2015) examine the valuation effects of multinationality on Korean firms to identify the role of multinationality in internalization theory. They find that multinationality and intangibility (R&D and marketing) directly and independently influence firm value measured by Tobin's q, without any interference from each other. They do not find evidence to support a mediating effect of intangibility through multinationality on firm value nor a moderating effect of intangibility on firm value. Multinationality in Korean firms has never lost its importance, even during the global financial crisis in the year 2008.

In a related manner, Kirca et al. (2011) test the predictions of internalization theory on the role of firm-specific assets in the M-P literature, using a meta-analysis method. Specifically, they examine the direct effect of firm-specific assets on firm multinationality, the mediating role of firm multinationality on the relationship between firm-specific assets and firm performance, the moderating role of firm-specific assets on the M-P relationship, and the M-P relationship for R&D intensive MNEs in manufacturing and service industries, for MNEs with high advertising intensity in service and manufacturing industries, and in high-tech and low-tech industries, advanced and developing economies. Through a meta-analysis of 120 independent samples reported in 111 studies, they find that multinationality provides an efficient mechanism to transfer their firm-specific assets to generate higher returns in foreign markets. Multinationality has intrinsic value above and beyond the intangible assets that firms possess after controlling for firms' international experience, age, size, and product diversification.

Our Analysis on the Positive Relationship

The linear positive model is built upon two underlying assumptions. The first assumption is that international opportunities are unlimited. However, this is highly improbable (Cardinal et

al., 2011). The second assumption suggests that firms can manage their portfolios of international activities effectively and efficiently. However, this assumption has inherent shortcomings. In reality, headquarter managers often face bounded rationality, and bounded reliability problems (Verbeke, 2013) in managing and coordinating the increasing complex international operations, which might have a negative effect on a firm's performance. Our analysis is consistent with Penrose (1959), who theoretically develops the research proposition that the finite capacities of the firm's internally experienced managers limit the rate at which the firm can grow in a given period of time.

Negative Relationship

A number of scholars highlight the additional costs of doing business abroad due to the liability of foreignness (Hymer, 1960; Zaheer, 1995; Eden and Miller, 2001). Li (2007) finds that the literature provides evidence of "the liability of international diversification", especially in the finance literature (Christophe, 1997; Collins, 1990; Denis et al. 2002; Michel and Shaked, 1986). They emphasize the negative performance implications of multinationality. Siddharthan and Lall (1982) show that increasing the degree of internationalization and organizational environmental complexity may eventually exhaust managerial capacity. Difficulties arise from high information processing demands, which are compounded by cultural problems. Similarly, researchers in cross-cultural studies have identified communication, coordination and motivations problems from cultural diversity in the firm (Hofstede, 1983).

Studies by finance scholars find negative impacts of internationalization on firm performance (Click and Harrison, 2002; Denis et al., 2002). Click and Harrison (2002) use a dataset for the period from 1984 to 1997 to analyze different measures for market value. They find that internationalization is consistently associated with market value discount compared to domestic operations. Capital markets penalize corporate multinationality by putting a lower

value on the equity of multinational corporations than on similar domestic corporations. The multinational discount is estimated to be in the range of 8.6 percent to 17.1 percent when Tobin's q is used for the analysis. Foreign assets are particularly associated with value destruction. In contrast, exporting from U.S. operations is associated with an export premium of approximately 3.9 percent, resulting from both a higher market value and a lower asset size. Then why do firms become MNEs? These scholars find that the proportion of a firm owned by management is inversely related to the likelihood that the firm is an MNE. Thus, they conclude that managers who do not own much of the firm may be engage in empire building for private gains at the expense of shareholders.

Similarly, Denis et al. (2002) argue that managers have an incentive to adopt and maintain value-reducing internationalization strategies, even if doing so reduces shareholders' wealth. This argument is deeply rooted in the agency theory, which is concerned with the opportunistic behavior of managers in investment due to information asymmetries (Ross, 1973). This can be a challenge for the MNE's governance system (Kim and Mauborgne, 1993). Furthermore, earlier studies also highlight the external costs of internationalization, such as financial and political risks. Financial risks, such as exchange rate fluctuations and inflation (Reeb et al., 1998) might offset the benefits of earnings stability derived from worldwide portfolio diversification. Political risks may arise when foreign governments enforce unanticipated change to the business environments, including fund remittance control, and expropriation (Boddewyn, 1988).

Our Analysis on the Negative Relationship

The negative model focuses mainly on the costs and risks of internationalization using parent-centric perspectives. However, it does not account sufficiently for benefits and returns on internationalization. In addition, it appears to underestimate subsidiary managers' capabilities to deal with the liability of foreignness, as they are the agents who run daily

business. Subsidiary managers leverage their local knowledge and experience to develop sustainable strategies, and generate necessary new strategic sources and capabilities to overcome challenges of operations in host countries (Birkinshaw, 1996, 1997; 1999; Rugman and Verbeke, 2001; Nguyen and Rugman, 2015a, b). In reality, parent firms delegate a certain degree of autonomy to subsidiary managers (Birkinshaw and Hood, 1998; Roth and Morrison, 1992; McDonald et al., 2008), as this enables the latter to be responsive to local conditions, consumer tastes and preferences, build local legitimacy, and reduce problems of bounded rationality and bounded reliability of headquarter managers.

Inverted J-Shaped Relationship

A number of scholars recognize that the M-P relationship might be non-linear because firm performance is determined by the effects of both benefits and costs of internationalization (Li, 2007). From the perspective of incremental internationalization, Daniels and Bracker (1989), and Geringer et al. (1989) suggest there exists a period of expansionary growth where benefits exceed costs, and another period during which incremental costs exceed incremental benefits. The M-P relationship takes on an inverted J-curve form. Firms benefit from economies of scale, scope and locations when they expand initially into culturally and institutionally similar business environments, whereby the additional costs of doing business abroad are low (see Li, 2007). Similar consumer tastes, market systems, and institutional settings make the transfer of marketing, management, human resources, and technology less costly as it requires little or no adaptation. Likewise, there are not many adaptation requirements for organizational structures, leadership approaches, and corporate control mechanisms. Financial and political risks are low (Daniel and Bracker, 1989; Geringer et al., 1989; Gomes and Ramaswamy, 1999).

However, as firms expand into unfamiliar markets later on, administrative costs, such as governance costs, information processing costs, coordination costs, etc. increase substantially

due to the challenges of external environment and internal organizational complexity (Ruigrok and Wagner 2003). Thus, there is a threshold of optimal degree of internationalization, in which performance maximum is identified at a degree of internationalization somewhere between 50-82 percent (Ruigrok and Wagner 2003). Performance appears to increase up to this critical zone, climax and then decrease monotonically (Daniels and Bracker, 1989; Geringer et al, 1989).

Our Analysis on Inverted J-Shaped

There are limitations of the inverted J-shaped model as it is built upon the internationalization theory. This theoretical model suggests firms expand first to geographically proximate and culturally and institutionally similar countries before entering into distant markets. However, in reality, firms from small countries tend to expand to distant countries when neighboring markets are small if they have a market-seeking motive for FDI. Another possibility is that firms need to go to distant countries when they seek strategic assets which are not available in proximate countries. Moreover, the model does not consider the possibility of mistakes, and slow learning during initial internationalization, which might lead to bankruptcy and divestures. Thus, the assumption, where firms attain a period of high performance in the initial internationalization (due to moving to neighboring markets) before their performance decreases (due to moving to distant markets), may not occur.

U-Shaped and Inverted U-Shaped Relationship

Hitt et al (1997) and Gomes and Ramaswamy (1999) draw upon the organizational learning theory to examine the M-P relationship. They hypothesize and empirically confirm that managerial experience with complex environments derived from mastering high product diversification provides the organization with knowledge for maintaining superior performance at high degrees of internationalization. Their findings indicate a positive linear relationship between internationalization and performance for firms with high product

diversification, a standard U-form for non-diversified firms and an inverted U-shape for companies with moderate product diversification. The findings of a positive linear relationship for firms with long experience in managing high complexity suggests that if properly prepared, firms may not experience declining performance at all.

Our Analysis on U-Shaped and Inverted U-Shaped Model

There are limitations of the U-shaped and inverted U-shaped model. Firm can accumulate experience through learning from different sources, such as direct experience, previous decision outcomes, and observing the experiences of other firms (Gao et al., 2008). They develop new capabilities, refined routines, and the ability to adapt which are based on experience. They have gained knowledge in dealing with the challenges of internationalization and the ability to reduce the liability of foreignness (Henderson, 1999; Baum & Shipilov, 2006). Consequently, the initial downward trend suggested by the U-shaped model may not occur when firms begin to enter foreign countries.

S-Shaped and Inverted S-Shaped Relationship

Sullivan (1994a) and Riahi-Belkaoui (1998) argue that the impact of internationalization on firm performance is delineated by an S-curve, which can be explained by the organizational evolution perspective and organizational learning theory. Lu and Beamish (2004) find a non-linear horizontal S-curved relationship between geographic diversification and firm performance, because management learns to adapt to the new complexities of environment. A number of studies (Contractor et al, 2003; Lu and Beamish, 2004; Ruigrok et al., 2007; Bae et al., 2008; Rugman and Oh, 2010; Oh and Contractor, 2014) have provided more evidence for the S-curve relationship.

Contractor et al. (2003) develop a three-stage model of international expansion and the link between M-P. The first stage includes an initially negative effect of international expansion on performance shown by a negative slope (U-shaped relationship) due to the costs and

barriers of initial internationalization, and the liability of foreignness. This is followed by a second stage of further internationalization with positive effects on performance represented in a positive slope where benefits of international expansion are now realized due to the achievement of economies of scale (Contractor, 2012). Finally, in the third stage excessive internationalization has a negative impact on performance shown by an inverted U-shaped relationship, which suggests that international expansion beyond an optimal level is again detrimental to performance and results in a negative slope.

Fisch and Zschoche (2011a) argue that the liability of foreignness and economies of scale are commonly used to substantiate the first stage of downward performance (falling) and the second state of upward performance (rising) of an S-shaped model between M and P relationship. These scholars apply the view of information costs (Casson, 1999), which is more inclusive than the view of transaction costs to substantiate the S-shaped curve. They use a dataset of 3,122 German MNEs provided by the Central Bank of Germany to empirically test their model. Their empirical findings suggest that economies of scale and the liability of foreignness are not closely correlated to the level of multinationality. Furthermore, they find that the S-shaped influence of multinationality persists while economies of scale and the liability of foreignness exert an influence on performance as distinct factors.

On the other hand, Chiang and Yu (2005) find an inverted S-shaped relationship between internationalization and Taiwanese firms' performances for the period from 1998 to 2002. They argue that the FDI activities of Taiwanese firms are concentrated in Asia (especially in Mainland China), which is both geographically and culturally proximate to Taiwan, so as to obtain the "market familiarity" advantage. The market familiarity facilitates the transfer of technology and managerial skills, but the continued expansion has to contend with the increasing complexity of global operation.

Our Analysis of S-Shaped and Inverted S-shaped

As with other models, the S-shaped model has limitations. If a firm's performance is poor following its initial international expansion, it might end up in bankruptcy. Consequently, the underlying assumption of an upward slope after a downward performance may not occur. In other words, there is no turning point from a downward to an upward performance. We illustrate our analysis with an example. Suntech Power was a Chinese solar energy solutions company with sales across the broad triad in 2011, having eight foreign subsidiaries, including one in the United States. However, it operated at loss. It could not service its debt obligations due to a heavy reliance on debt financing. In March 2013, Suntech was the first company from mainland China to default on its US bonds payment of US\$541 million (Morales & Martin, 2013). Subsequently, Suntech's main unit, Wuxi Suntech Power Holdings Co., Ltd. was placed into insolvency as Chinese banks filed bankruptcy against Suntech (Goossens & Doom, 2013; Sui-Lee, 2013). The company's American Depository Receipts were delisted from the New York Stock Exchange and placed on the over the counter exchange (for a detailed analysis, see Rugman et al., 2016).

Other Contextual Factors

Recent studies have taken into account the impact of MNE cultural diversity on the M-P relationship (de Jong and van Houton, 2014), and multinationality alignment and performance (MA-P) instead of the traditional M-P relationship (Powell, 2013). Powell (2013) suggests that rather than searching for a universal optimal level of M for all firms, firm-specific attributes should result in firm-specific optimal levels of multinationality. Drawing upon transaction cost and internalization theory, he argues that there will be different optimal levels of multinationality for individual firms, and if firms internalize foreign operations to an extent less than or greater than their individual optimal levels, transaction costs will increase and performance will decrease. He uses a dataset of the U.S. law firms and provides empirical evidence to support these hypotheses. However, this study

has limitations in terms of generalizability as it is the U.S.-specific and the legal service industry-specific.

In a related manner, Kirca et al. (2012) use a meta-analysis method to examine the role of context in the M-P relationship. Their findings suggest that the effects of M on P depend on firm factors (firm size), type of M (depth of M measured by FS/TS and FA/TA and breadth of M measured by number of countries), firm strategic motivations (revenue generation versus profit maximization), stage of internationalization (firms with the average FS/TS ratio of 10 percent and below are considered at early stage of internationalization; firms with an FS/TS ratio of 11 to 35 percent were assumed to be at intermediate stages; and firms with an FS/TS greater than 35 percent were categorized at the late stage of internationalization (Zahra et al., 2000; Zhou et al., 2007), industry factor (manufacturing versus service), and home country factor (developing versus developed).

Our Analysis on Other Contextual Factors

The measurement of the stage of internationalization and the related thresholds is a matter of concern. The FS/TS ratio includes exports by parent firms from home countries and sales by foreign subsidiaries in host countries. Firms can achieve the FS/TS ratio greater than 35 percent through exports, not necessarily through value-adding FDI activities by their foreign subsidiaries. For instance, Chinese firms could achieve a high FS/TS ratio through their exports from China. It does not mean that they are at a late stage of internationalization through FDI. We illustrate this point with an example. Ningbo Veken Elite Group is a Chinese firm specializing in textiles, yarn, fabric and garments. It has a FS/TS ratio of 53.20 percent through exports in 2012, but it has only three foreign subsidiaries mainly used to facilitate export sales from China to foreign markets (Ningbo Veken Elite Group, Annual report, 2012). In business reality, Chinese firms are in the early stage of internationalization

through FDI following the Chinese government's "go global" policy in 2000 (see Rugman et al., 2016).

Inconsistency 5: The Omission of Risk-Return Trade-off in Research Design

Forty years ago, Rugman (1976) conducted pioneering work on risk reduction by considering international diversification in the field of IB research. He finds that it is possible for MNEs to reduce the risk of their profits by engaging in foreign operations. His empirical results show that foreign operations are inversely related to risk after controlling for size, industry classification, and other factors. This implies that international diversification offers MNEs significant risk reduction advantages which are not available to a non-MNE.

However, subsequent empirical M-P studies, excepting Hughes et al. (1975), Buehner (1987), Michel and Shaked (1986), and Kim et al. (1993), have largely neglected the risk-return relationship, which Verbeke and Brugman (2009) sharply criticize. In contrast, corporate finance focuses extensively on the risk and return trade-off. Bower et al. (2010) maintain that a finance approach would agree with the risk-return theoretical argument made by Verbeke and Brugman (2009). Bower et al. (2010) emphasize that consideration of risk is central to the appraisal of any investment decision. Basic finance theory advocates allocating resources to investment opportunities to equalize expected return per unit of risk (or risk adjusted return) across projects. From a theoretical viewpoint, a comparison of any measure of financial return, unadjusted for risk(s), across projects is difficult to justify. Bower et al. (2010) argue that the omission of adequate controls for risk in many M-P studies implies that the methodology is deeply flawed.

Our Analysis on the Omissions of Risk-Return Trade-off

The omission of the risk-return trade-off may be attributed to various possible explanations. First, the underlying assumption that there is a relationship between M and P has become an established norm in the IB literature. Consequently, the majority of previous studies do not

look at the phenomenon from a different angle, such as to bring finance factors into the IB research design. Unsurprisingly, there are very few studies using financial returns (adjusted for risks) in the performance assessment, excepting Hughes et al. (1975), Buehner (1987), Michel and Shaked (1986), and Kim et al. (1993). In a related manner, a large number of studies use ROE as a key performance indicator but do not control for the effects of financial leverage in the capital structure of the firm, e.g. debt-to-equity ratio, excepting Delios and Beamish (1999), Marther et al. (2001), and Thomas and Eden (2004). The higher the level of debt, the higher the ROE, but it also implies higher bankruptcy risks, financial distress and cost of capital for the firm.

Second, empirical work requires data collection from multiple sources (e.g. firm data, home and host country risk data, etc.), which are contingent upon access and availability. Third, reading and conducting content analysis of firms' annual reports to obtain an in-depth understanding of their risk management strategies is a time-consuming and demanding task for researchers in comparison with the common practice of extracting data from large databases.

Inconsistency 6: Methodologies and Geographic Focus

Our analysis of methodological approaches adopted in the selected articles is important, because it shows how rigorous and generalizable the findings and conclusions are. Our findings are that 100 percent of empirical studies in our sample use quantitative methods and regression techniques with increasingly sophisticated models. In terms of the unit of analysis and data sources, all these articles use parent firm-level secondary and archival data sourcing from large databases, such as Compustat, Osiris, Amadeus, and Japanese Overseas Investments, etc. Virtually, none of previous studies use survey data or attempt to obtain insights from MNE managers from field research.

Another important element of our analysis is that we assess the geographic focus of empirical articles (102 studies), because it has an important impact on the nature of research findings and conclusions. Table 3 presents the distribution of studies according to their geographic focus. Our analysis clearly shows that the United States (the U.S.) and the U.S. firms are the dominant geographic focus in the publication. There are 60 out of 102 articles using US MNEs dataset (almost 60 percent). Studies of European firms (British, German, Swiss and Spanish MNEs) are in the second position (18 papers-18 percent of the total set). Next are Japanese firms (seven papers-seven percent), other Asia Pacific countries (Hong Kong, Korea, Singapore and India) (six papers-six percent), and Canada (one paper). Out of 102 studies with empirical evidence, there are 92 studies using single country datasets (90 percent), and only ten studies using multi-country datasets (ten percent).

Table 3

The results might have various explanations. First, MNEs from the U.S., Europe, and Japan have been amongst the largest and the most active in international markets for a long time. In contrast, firms from emerging economies have internationalized relatively recently (Jormanainen and Koveshnikov, 2012). Second, firms in advanced economies are subject to rigorous requirements in terms of financial data reporting and disclosures. Data availability in large databases is one of the key factors in this research stream. Consequently, to some extent, the M-P literature has become data-driven rather than theory-driven. Third, academic scholars from the U.S. and Europe are actively engaged in investigating the phenomenon of firms of their countries of origin.

There are some methodological limitations in the existing literature. First, the majority of studies are based on a single country, secondary data sources focusing on large MNEs in advanced economies. Thus, this restricts the ability to reflect upon the state of the phenomenon. Second, the dominant use of secondary archival data and quantitative analysis

in 100 percent of the empirical sample included in our review is probably another methodological limitation. The use of survey and interview data with MNE managers could be complementary to secondary data and qualitative research methods might provide some useful insights on the topic (Yin, 2003). Third, our review analysis reveals that there is a clear lack of comparative analysis studies, and mixed method research design. For example, articles in which the performance of the U.S. firms is compared with that of Japanese or European firms or vice versa are scarce, except Hall & Rutherford (2003) to compare the U.S. and Korean firms, and Elango and Sethi (2007) to compare firms from small open economies and large economies with modest trade.

Finally, the strong bias towards evidence obtained from the U.S. context is another methodological limitation of the existing literature. This biased geographic focus is problematic, and the generalization of the findings might be limited. In addition, we compare and analyze the empirical results of articles which use the U.S., Europe, and Japanese firms' datasets. We find that previous studies produce mixed results for firms from the same countries of origin. These differences are probably attributed to internal firm-specific characteristics, external business environments in home and host countries, industries, and sectors. Our findings here are consistent with the meta-analysis study by Kirca et al. (2012), as these scholars emphasize that the context (firm, industry and home country) should be accounted for in the M-P literature.

Suggestions for Future Research

This section offers directions for future research to clarify the inconsistencies. We hope that we will gain a deeper understanding of the impacts of international activities on firm performance. First, we provide a detailed review of previous meta-analysis, literature review, and conceptual articles, in which findings and suggestions for future research by the article authors are reported in Table 4. Second, we present our theory-driven and empirically

testable suggestions as we believe that such a practical and solution-oriented approach will be useful for future research. Third, Table 4 can be used to compare and contrast our recommendations with those of previous studies.

Table 4

We elaborate our suggestions in detail as follows:

Suggestion 1: The Key Determinant of a Firm's Performance is FSAs, Not Multinationality per se: An Integrated Perspective of Internalization Theory and Accounting

From the perspective of internalization theory, the performance of an MNE is not determined by the degree of multinationality, or other aspects of FDI, but by the basic FSAs of the firm itself (Rugman, 1981; Morck and Yeung, 1991; Rugman and Verbeke, 2008; Verbeke & Brugman, 2009; Kirca et al., 2011; Nguyen, 2011; Rugman et al., 2011; Matysiak and Bausch, 2012; Lee et al., 2015). The FSAs can be developed by parent firms in home countries and by foreign subsidiaries in host countries (Rugman and Verbeke, 1992, 2001; Rugman et al., 2011; Rugman and Nguyen, 2015a, b). In either case, the potential recombination of FSAs with home and host country CSAs is the nexus of strategy for the MNE (Rugman, 1981; Rugman et al., 2011; Nguyen, 2011; Verbeke, 2013).

Rugman and Verbeke (2008) argue that the basic regression on the M-P relationship is misspecified from the perspectives of internalization theory. Multinationality (M) is really an intermediate variable, not an independent variable. Rugman and Verbeke (2008) maintain that if performance (P) is the dependent variable, the true independent variables are FSAs (Rugman, 1981). Rugman and Verbeke (2008) emphasize that these FSAs should never be used as control variables but as the true independent variables determining the performance

of an MNE. Our suggestion here is consistent with Rugman (1981), and Rugman and Verbeke (2008).

Furthermore, we extend Verbeke & Brugman (2009) by integrating internalization theory in the IB literature with the perspective of accounting. The determinants of a firm's performance are the efficient and effective utilization of resources and obligations in the balance sheet to deliver performance in the income statement. In other words, a firm's performance is determined by its managerial capabilities of development, deployment, utilization, combination, and the exploitation of its resource bundles (FSAs). The parent firm's financial performance is the consolidated results from the operations within the home country and its network of foreign subsidiaries.

We recommend future research to examine other components in the balance sheet as measurements for FSAs. These include intangible fixed assets (see our earlier discussion on IAS38-*Intangible assets*); financing sources of liabilities and owners' equities; the use of an efficient internal capital market within the organization structure of the MNE to overcome external capital market imperfections (Rugman, 1980; Mudambi, 1999; Desai et al., 2004; Aulakh and Mudambi, 2005; Nguyen and Rugman, 2015b); and especially financial management capabilities using survey data (Nguyen & Rugman, 2015b). They are sources of international competitiveness and drivers of value creation for the MNE. In addition, future research is recommended to examine a firm's effectiveness in utilization and exploitation of combined tangible and intangible assets, and financing sources through their foreign subsidiaries.

Suggestion 2: There is a Reverse Effect of Profitability and Overall Performance on FSAs.

One fruitful direction for future research is to examine the use of retained earnings to finance reinvestments in the continuous development, creation and generation of FSAs for

sustainable expansion and growth of the firm. In business reality, if an MNE's operation is profitable, it might pay out dividends (depending on its dividend and financing policies). The firm always retains a proportion of profits, known as retained earnings. This is a type of internal equity financing, i.e. internally generated financing sources within the firm as opposed to externally raised equities on the stock exchanges through share issues (Nguyen & Rugman, 2015b; Rugman & Collinson, 2012). This is related to the decision of profit reinvestment (reinvested earnings), i.e. the firm retaining and reinvesting its profits into the existing operations (Rugman & Collinson, 2012; Nguyen, 2015b; Nguyen & Rugman, 2015b). Our suggestion is built upon the pecking order theory in the finance literature (Myers and Majluf, 1984). There is information asymmetry between managers (insiders) and investors (outsiders). Managers have more inside information than investors and act in favor of old shareholders. The cost of financing increases with information asymmetries. Thus, there is a "pecking" order in corporate financing, in which internal funds (retained earnings) will always be preferred to debt and equity.

We suggest a number of relevant research questions for future studies: To what extent does the firm use retained earnings to finance reinvestments in R&D, given that there are information asymmetries between firms and capital providers and that debt is poorly suited to R&D funding (Brown et al., 2013)? How does this reinvestment strategy relate to dividend and financing policies? What is the role of retained earnings as a financing source for foreign subsidiaries of MNEs of advanced economies operating in emerging economies where external financial markets are underdeveloped? What are the effects of financing sources on the performance of the firm? How do financial management capabilities affect the strategy and the performance of the firm?

These broad questions are related to the three most important, inter-related decisions in financial management in the MNE, namely, investment, financing and dividend. However,

the IB literature focuses mainly on initial FDI investment, such as entry mode choice (greenfields versus acquisitions), ownership types (wholly owned foreign subsidiaries WOFSs versus joint ventures JVs), and location choice (Nguyen, 2013). It should be noted that initial FDI might be subject to change over time, such as adjustments to operating modes (e.g. acquire a JV's partner and convert a JV into a WOFS), additional investments or divestments. However, financing, dividend and profit reinvestment strategies have been largely under-researched in the IB literature despite their important implications for MNE managers and public policy makers (Nguyen, 2013; 2015b).

Our recommendation differs from Verbeke and Brugman (2009) who suggest testing the reverse effect of performance on multinationality due to endogeneity concerns. This methodological issue can be addressed using statistical techniques, such as a two-stage least square (2SLS) regression with an instrumental variable approach (Bowen, 2007). Other alternative approaches dealing with endogeneity include control variables and fixed effects, matching and propensity score models, natural experiments, and regression discontinuity design (for endogeneity in IB research, see Reeb et al., 2012; for econometrics, see Wooldridge, 2009).

In addition, we adopt the perspectives of accounting and financial management to analyze the suggestion of testing the reverse effect of performance on multinationality. A firm might consider different investment options other than multinationality after they take into consideration of dividend and financing requirements (Desai et al., 2007; Rugman & Collinson, 2012; Nguyen & Rugman, 2015b). For example, investments in financial assets include marketable securities, bonds, etc. Investments in non-financial assets involve purchases of physical, tangible fixed assets (e.g. properties, plants, and equipments). Other investments are R&D and innovation activities for development and introduction of new products and services, and/or improved process or new business methods; patented

technology and other intellectual properties; investments in distribution reach and market coverage, and supply chain networks. Alternative options include cash holdings (Foley et al., 2007; Opler et al., 1999; Pinkowitz et al., 2007; Pinkowitz et al., 2012), and share repurchase/stock buy-back. Finally, the firm might consider expanding domestic and/or international operations contingent upon the growth potential and business opportunities of domestic and foreign markets.

Taking our analysis altogether, we believe that investigating the reverse effect of profitability and overall performance through the use of retained earnings as an important financing source for the reinvestment in FSAs creation is probably a new promising avenue for future research.

Suggestion 3: Replace the Traditional Measurements of Multinationality by Geographic Segment (Regional) Measurements in Accordance with International Accounting Standards in Operating Segment Reporting and Disclosures (IFRS8 and US GAAP FASB131)

The measurements of multinationality (M) research need to be re-thought in terms of the accounting data available. Specifically, the international financial reporting standard IFRS8- *Operating Segments* and the US GAAP FASB 131 *Disclosures about Segments of an Enterprise and Related Information* provide detailed guidance on segment reporting and disclosure requirements. The IFRS8 standard requires public listed entities to disclose information about operating segments, products and services, the geographic areas in which they operate, and their major customers. Information is based on internal management reports, both in the identification of operating segments and measurement of disclosed segment information. Reportable segments are operating segments or aggregation of operating segments that meet specified criteria of either revenues, or profit/loss, or assets at

10 percent or more of the combined revenues, or profit/loss or assets (see IFRS8 and US GAAP FASB131 websites).

Most of the world's largest firms now report and disclose their geographic segments of sales and/or assets, and related data according to broad geographic regions, such as Europe, North America and Asia Pacific. This allows the traditional multinationality metrics, namely the ratio of foreign sales/ assets/ employees to total sales/ assets/ employees to be replaced by the ratio of regional sales/ assets/ employees to total sales/ assets/ employees. Rugman and Verbeke (2004) provide thought-provoking evidence that MNEs are regional, not global in nature (Rugman and Verbeke, 2004, 2008; Rugman, 2000, 2005, 2007; Rugman and Sukpanich, 2006; Rugman and Oh, 2011; 2013; Oh and Rugman, 2014). Similarly, the foreign subsidiaries of MNEs operate on an entirely home-region basis (Nguyen, 2014, 2015a).

Qian et al. (2008) argue that regionalization can be an optimal way of dealing with empirical conflicts in the M-P literature. Countries within a given region can be relatively similar, in relation to those across regions, in terms of culture, economic development and psychic distance, which measure accurately the costs and benefits associated with international expansion. The expansion of most MNEs is regional rather than global, that is, globalization implies regional diversification rather than balanced, evenly distributed global diversification (Rugman, 2000, 2005).

Furthermore, Rugman and Verbeke (2004) argue that there are significant differences in geographic international expansion costs, in which the liability of intra-regional expansion (i.e. geographic expansion within a home region) is lower than the liability of inter-regional expansion (i.e. geographic expansion across regions). Qian et al. (2013) emphasize that “the liability of country foreignness (LCF)” and “the liability of regional foreignness (LRF)” are different concepts. In terms of conceptualization and measurements, Rugman and Oh (2013)

have developed regional scale and scope metrics using regional data, which can be employed to address Verbeke & Brugman's subtest on DI and DID.

The literature will gain an insight into the relationship between M-P by observing and comparing the performance of firms with different levels of regional diversification (Qian et al., 2008). Overall, we suggest that it will be interesting to research if operations in particular regions are more promising than in others.

Suggestion 4: Focus on a Clear Analysis of the Effects of Home Country Operations on Return on Home Assets (ROHA), and the Effects of International Operations on Return on Foreign Assets (ROFA), instead of Examining the Effects of Multinationality on Return on Total Assets (ROTA) as in the Current Literature

The key question in terms of assessing a firm's performance is whether or not foreign operations can achieve similar or excess profits in comparison with domestic or other already existing activities. We suggest that the performance measure, such as the consolidated performance results of return on total assets (ROTA) should be decomposed into return on foreign assets and foreign presence (ROFA), and return on home assets and home presence (ROHA) (Gestrin et al., 1998; Rugman et al., 2008). In other words, it would be more logical to assess the relationship between the degree of multinationality and ROFA, not ROTA as in the extant literature.

It is now possible to calculate return on foreign assets (ROFA) and return on home assets as firms report these types of data. However, this approach has been rarely undertaken in previous empirical M-P studies. The studies by Gestrin et al., (1998), and Rugman et al. (2008) are the first and the only ones which have used the new metric of ROFA to examine the return on foreign assets and foreign presence of MNEs, and differentiate between ROHA, ROFA and ROTA. Rugman and his co-authors use carefully hand-coded data, which are collected from firms' annual reports.

On the other hand, Fisch and Zschoche (2011a, b) examine the aggregated foreign performance of all foreign subsidiaries of German parent firms in terms of ROS and ROE. They have access to a database collected by the Central Bank of Germany of all FDI by German firms. Such efforts by Gestrin et al. (1998), Rugman et al. (2008), and Fisch and Zschoche (2011a, b) in their empirical studies have shed new light on the M-P phenomenon. Our suggestion here provides a clear and practical empirical solution on how to isolate the effects of international activities on performance from those of the home country activities when it comes to the correct assessment of the impact of M on P, a point which has been briefly commented by Verbeke and Brugman (2009). Overall, we recommend that future research integrates accounting standards and reporting requirements into IB research to improve the empirical design.

Suggestion 5: Use Alternative Value-Based Performance Measurements

The value of a firm should be assessed on the basis of its future prospects. Specifically, there is a growing interest in measuring shareholder value as opposed to earnings (Martin and Petty, 2007). The concept of Economic Value Added (EVA) originates with the consulting firm Stern Stewart and Co. (Stewart, 1991). EVA is an estimate of a firm's economic profit, which is the value created in excess of the required return of the firm shareholders. EVA measures the firm's financial performance based on the residual wealth calculated by deducting cost of capital from its operating profit (adjusted for taxes on a cash basis). The formula to calculate EVA is as follows: $EVA = \text{net operating profit after tax (NOPAT)} - (\text{capital} \times \text{cost of capital})$. Shareholders gain when the return from the capital employed is greater than the cost of capital. In other words, EVA measures real wealth for shareholders and it is subject to less distortion by accounting policies and above all it is computed in absolute values.

In reality, financial analysts make adjustments to accounting data in calculating EVA as they attempt to assess estimated future cash flows. These adjustments include expenditure on R&D for innovation creation and marketing for brand and corporate reputation generation, as well as on staff training for skill development. This approach may contradict the international accounting standard IAS38, because it is too strict in these aspects and discourages managers from investing in intangible knowledge creation and generation, and the development of managerial capabilities which bring long-term benefits to the firm (Martin and Petty, 2007). However, EVA also has limitations because it focuses on short-term objectives.

Our suggestion to use value-based performance measures is consistent with Bowe et al. (2010). These finance scholars suggest that the dependent variables in future M-P research should be able to capture the strategic contribution of on-going corporate projects and firm-wide performance by focusing on corporate cash flows. This would signify that a value-based performance measure, such as cash flow return on investment (CFROI) over an appropriate time horizon, could be among the most suitable measures.

Suggestion 6: Incorporate Finance Factors in the Research Design

We suggest future studies take into account different types of risks (e.g. country risks, operating risks, financial risks, interest rate risks, foreign exchange risks, credit risks, etc.) in the research design. In addition, it will be interesting to conduct content analysis of firms' annual reports to examine how they manage risks as this type of information can be collected from firms' discussion of risks and risk management strategies. When it comes to performance assessment, future research is recommended to use financial returns, adjusted for risks. Our suggestion is in line with Verbeke and Brugman (2009), and Bowe et al. (2010).

Another direction for future research is to use the financial benchmarking method. Financial benchmarking is defined as the establishment by the collection of data of comparators which

allow relative levels of performance to be identified (Drury, 2009; Seal et al., 2011). The performance of a firm is benchmarked relative to global peers using the industry financial data (a peer group analysis method). This method comes from the field of management accounting and financial management, and it is widely applicable in enterprise risk management, which helps to manage risks across the enterprise, and in the specific areas of credit, market and operational risks.

The studies by Rugman (1983), Rugman and Nguyen (2014), and Rugman et al. (2016) are among the first few attempts, to use the financial benchmarking method to compare the performance of firms in different countries, and to benchmark the performance of firms with global peers using the industry financial data. To some extent, the financial benchmarking method might address some of the criticisms from finance scholars who find that the risk issues have been largely neglected in the existing M-P literature (Bowe et al., 2010). In addition, this method is a useful tool for a comparative analysis, and thus it can be used to address a lack of comparative studies in the current state of the M-P research.

Furthermore, our recommendation to use the financial benchmarking also advances the traditional method used in previous empirical studies of the 1970s-1980s where a comparative approach is employed in which the relative performance of domestic and multinational firms are examined (Annavarjula and Beldona, 2000). We suggest that with fast changing international business environments and increasingly intense competition worldwide, it is more relevant to compare MNEs' performance with their global peers rather than domestic firms.

Suggestion 7: The Need for Research for Other Countries than the United States Context, and the Requirement of Comparative Studies

We recommend that future research examine strategies and performance of firms from countries other than the U.S. to overcome the inherent limitations of the existing literature,

which predominantly reflects the corporate behaviour of the U.S. MNEs, the U.S. institutions and business environments, and the U.S. financial markets. A diversity of research contexts and geographic focus will enhance the generalizability of the findings of the literature.

Future empirical studies are suggested to compare and contrast firms from the U.S., Europe, and Japan, those from advanced and emerging economies; firms and their global peers in a particular industry. The insights of comparative studies will enhance our understanding of the research phenomenon, such as whether or not FSAs and multinationality have similar or different effects on the performance of firms from different countries of origin after controlling for the potential effects of firm characteristics, home and host country factors, time periods of investigation, industries and sectors; what are the plausible theory-driven explanations for such similarities and/or differences. The findings from such comparative analysis will provide important practical implications for MNE managers, and advance our theoretical and empirical academic research. Another solution is to conduct cross-country analysis.

Suggestion 8: Examine the Phenomenon from a Subsidiary-Level Perspective

The unit of analysis is another important issue. Most M-P studies use the parent firm as the unit of analysis and investigate their hypotheses using parent firm-level data. They cannot control directly for the impacts of the interplay between FSAs and internationalization, and performance at the actual level of analysis, which is the foreign subsidiary. In addition, the M-P literature adopts parent-centric perspectives, in which the headquarters transfer knowledge-based FSAs to foreign subsidiaries. Decisions relating to the exploitation of intangible assets and the development of foreign markets are frequently made in the headquarters. This is in line with “classic” internalization theory (Buckley and Casson, 1976; Hennart, 1982; Rugman, 1981). However, in business reality, MNEs face difficulties in transferring FSAs developed by parent firms in home countries to foreign subsidiaries in host

countries due to the tacit nature of knowledge and location-boundedness and region-boundedness of FSAs (Rugman and Verbeke, 1992; Rugman & Sukpanich, 2006; Nguyen, 2015b).

Rugman and Verbeke (1992, 2001, 2002) emphasize that FSAs can be created by both parent firms and by foreign subsidiaries. Rugman and Verbeke (1992) refer to this line of thinking as “new” internalization theory, which is an extension of “classic” internalization theory. Subsidiary initiatives are instrumental for the development of subsidiary-specific advantages (SSAs), which are a special type of FSAs. Previous literature documents that foreign subsidiaries develop new competencies and capabilities in innovation and organizational management, which enhance efficacy for the entire MNE (Birkinshaw, 2000; Cantwell and Mudambi, 2005). Foreign subsidiaries are the engines which drive the combination of knowledge and resources transferred from parent firms with newly-created knowledge and competencies in innovative ways. The recombination knowledge bundles enable them to operate successfully in host countries and ultimately contribute to the performance of their parent firms (Nguyen and Rugman, 2015a, b).

We suggest that future research examine the M-P phenomenon from a subsidiary-level perspective. Studies into the relationship between subsidiary strategy, subsidiary role, decision making of subsidiary managers, development of subsidiary-specific advantages, subsidiary autonomy, host country environments, and subsidiary performance will deepen our understanding of the strategy and performance of the parent firm. Furthermore, such a bottom-up approach is an alternative solution enabling analysis of the strategy and performance of foreign operations of the MNE, because the parent firm performance is the consolidated results from the operations of home country and foreign subsidiaries.

For example, Nguyen and Rugman (2015b) draw upon the insights of new internalization theory in the IB literature (Rugman and Verbeke, 1992, 2001), and the pecking order theory

in the finance literature (Myers and Majluf, 1984) to examine the relationship between internal equity financing, subsidiary-level financial management capabilities and decision making, and the performance of multinational subsidiaries. The performance is measured by both financial and non-financial indicators, such as actual performance against budget of sales growth, profit growth, return on capital employed (ROCE) and market share growth. They also integrate international accounting standards in their questionnaire design, and they collect data from a survey with managers of British multinational subsidiaries in six countries in the ASEAN region (Malaysia, Indonesia, the Philippines, Singapore and Thailand). The first finding is that that internal equity financing acts as an FSA to improve subsidiary performance. The second finding is that over 90 percent of financing sources (including capital investment by the parent firms) in the British subsidiaries come from internal funding. The third finding is that subsidiary-level financial management decision-making has a statistically significant positive impact on subsidiary performance.

To investigate the major financing sources of the subsidiary, Nguyen and Rugman (2015) ask ASEAN subsidiary managers of British MNEs how they organize their actual financial arrangements. They find that on average, these subsidiaries rely on capital investments transferred from the parent firm for 56 percent of their total funding; on retained earnings for 29 percent; and on intra-firm borrowing (including from the parent firms) for eight percent. Only seven percent of their funding comes from host-country financial institutions and other foreign financial institutions outside host countries. Of the total sample, they find that 84 percent of subsidiaries are profitable. In other words, these subsidiaries use retained earnings to finance continuous improvement of their existing FSAs and development of new FSAs (after they make dividend, interest and royalty payments to their parent firms). This helps foreign subsidiaries to sustain and to maximize their sales growth and overall performance.

These findings provide full support for the pecking order theory and reinforce the importance

of internal capital markets within the MNE organizational structure in accordance with the predictions of internalization theory (Rugman, 1980; Mudambi, 1999; Aulakh & Mudambi, 2005; Desai et al., 2004; Aggarwal & Kyaw, 2008). The study by Nguyen and Rugman (2015b) is among the first to test the inter-relationship between FSAs and performance (through retained earnings), as they adopt an original approach of integrating finance theory and accounting principles into IB research.

Rugman and Nguyen (2015b) contribute to the development of theory by advancing the concept of internal equity financing as an FSA, alongside other traditional FSAs in R&D, innovation, brand and marketing. It is important to recognize that external financial markets in emerging economies in general, and in the ASEAN region (except Singapore) in particular are underdeveloped due to different types of institutional voids. The credit availability might be deficient, the costs and interests of borrowing are high, the access to external financing opportunities might be challenging. Subsidiary managers make strategic decision to use their own retained earnings, which are important financing sources to finance continuing expansion and growth, and to overcome imperfect external capital markets in the host countries. The reinvestment projects are reviewed, assessed, and approved by the headquarters in the annual budgeting in accordance with the requirement of reinvestment rates (Nguyen, 2015b). This reflects the development and exploitation of financial management capabilities and decision making of subsidiary managers, as they have leveraged their local knowledge and experience to develop sustainable financial management strategies.

Conclusions

We provide a comprehensive and critical analysis of the multinationality (M) and performance (P) literature by adopting a novel and original inter-disciplinary approach to integrate international business (IB), accounting, and finance perspectives. We examine 135

articles in 39 leading journals and classic books. We find that the majority of previous studies focus on investigating the effects of multinationality on a firm's performance rather than examining the effects of a firm's internal resources and external environment factors. We review the theoretical foundations, concepts and measurements of M, P and the findings on M-P relationships. We identify six key inconsistencies, which cause ambiguity in the current literature. We offer plausible explanations, which include a wide range of theoretical perspectives, inconsistencies in conceptualization and measurements, an omission of risk-return trade-off, a lack of diversity in geographic focus and research context (the literature is distorted by the dominating use of the U.S. firms' datasets), and a deficiency of comparative studies.

We make eight recommendations for future research directions. Specifically, we suggest that the M-P literature will be more theoretically compelling and empirically robust when IB, finance theories and accounting standards are integrated in future IB research design. From the perspective of internalization theory, the key determinants of a successful IB strategy and thus the performance of an MNE are the basic FSAs relative to rivals, and the effectiveness and efficiency in deploying and augmenting these FSAs across borders, not multinationality per se (Rugman and Verbeke, 2008; Verbeke and Brugman, 2009; Nguyen, 2011; Verbeke, 2013). From the accounting perspective, a firm's performance as reported in the income statement is determined by the efficient and effective deployment, utilization and exploitation of resources and obligations in the balance sheet. Furthermore, we suggest that there is an inter-relationship between FSAs and performance, i.e. FSAs determine performance, which in turn a proportion of profits are then retained in the form of retained earnings and are used to finance reinvestment in the continuous development, generation, and creation of FSAs. This important message differentiates our suggestions from the current literature.

In addition, we recommend that the traditional multinationality measurements need to be rethought as firms have long implemented the international accounting standard on operating segments reporting and disclosures, especially their geographic operating segments (IFRS8 and US GAAP FASB131). The performance assessment needs to isolate the effects of international activities on return on foreign assets (ROFA) from the effects of home activities on return on home assets (ROHA). We suggest that future research incorporate finance-specific factors and risk issues, and use value-based performance measures as it is important to take into consideration the cost of capital of both debt and equity financing. We recommend that future studies move beyond the context and dataset of U.S. firms so that the generalizability of the findings can be improved. Comparative studies which compare and contrast strategies and performance of firms from different countries and/or regions are particularly needed. It is suggested that future research examine this phenomenon from a subsidiary-level perspective. We hope that all these efforts will deepen our understanding of the M-P phenomenon.

Acknowledgements: We would like to thank Professor Joachim Wolf and two anonymous reviewers for their helpful comments and suggestions, which significantly improved this paper.

Table 4: Summary of previous meta-analysis, literature review, and conceptual articles on the M-P relationships

| Studies | Types | Sampling and Focus | Findings | Suggestions for future research |
|--|---------------|--|---|---|
| Bausch, A. & Krist, A. (2007) | Meta-analysis | 36 papers of MNEs, and SMEs. Focus: the effects of context-related moderators on the M-P relationship | <ul style="list-style-type: none"> - Synthesis of the extant literature on the M-P relationship. - Theoretical arguments from a wide range of established theories imply mechanisms for benefits and costs of M. - Variety of operationalizations of M and P measurements. - Meta-analysis shows that there is a significant positive relationship at the aggregate level between M and P, although the effect size is small in magnitude. - The relationship is moderated by the context-related moderators of R&D intensity, product diversification, country of origin, firm age, and size. | <ul style="list-style-type: none"> - Future research should not look for M-P generalizations, but instead develop more fine-grained models, i.e. the conditions under which M might be fruitful. - Consideration of other contextual factors on size of effect: industry, competition, exchange fluctuation, and strategic action variables, e.g. entry mode choice, composition of senior management and incentive system, and differences in the internationalization process itself contributing to performance differences. |
| Kirca, A.H., Hult, G.T.M., Roth, K., Cavusgil, S.T., Perry M.Z., Akdeniz, M.B., Deligonul, S.Z., Mena, J., A., Pollitte, W. A., Hoppner, J.J., Miller, J.C. & White, R.C. (2011) | Meta-analysis | 120 independent samples reported in 111 papers of MNEs, SMEs, INVs, internationalization of top management team (TMT). Focus: firm-specific assets, multinationality (M), and financial performance | <ul style="list-style-type: none"> - Draw upon internalization theory to examine FSAs, M, and P relationships: FSAs and M relationship; the mediating effect of M on FSAs and P; the moderating effect of FSAs on M and P; FSAs, M, P relationship in the context of industries (R&D intensive versus marketing intensive in manufacturing and service industries; high-tech and low-tech industries), and countries (advanced versus developing economies), while controlling for strategic firm resources (firm size, international experience, age, product diversification). - Measurements for FSAs: R&D, advertising; Multinationality; Performance (P): ROA, sales, ROS, profitability, sales growth, ROE, Tobin's q, ROI. - Multinationality provides an efficient organizational form to transfer FSAs which have positive impacts on firm performance. - M has intrinsic value above and beyond FSAs. | <ul style="list-style-type: none"> - Investigation of M-P relationship in conjunction with marketing standardization programme, entry mode choice, scale of entry, speed of internationalization. |

|----------------------|------------------|---|--|--|
| Hennart, J-F. (2007) | Conceptual paper | Focus: theoretical debate | <ul style="list-style-type: none"> - Review and critical evaluation of the main theoretical arguments in the extant literature for a positive M-P relationship: international diversification and risk reduction; multinationality and profitability based on arguments of the economies of scale; the flexibility; the learning effects. - Methodological issues: contradictions between theoretical arguments and operationalization of the main independent variable, international diversity and a lack of adequate control variables. - Transaction cost/ internalization (TCI) theory implies no direct and general relationship between M and P. | <ul style="list-style-type: none"> - Future studies should be performed at a lower level of aggregation, e.g. a detailed industry level. This allows control for the size of an MNE's home market, the cultural diversity of the markets it has entered, and intangibles. Comparisons of firms within a given industry, following similar strategies and having similar cost curves with similar minimum efficient scale (MES), but based in home markets of different sizes: costs and benefits of ID. - Use longitudinal data to test the three-stage model. - The role of management; strategies and organizational structures in M-P. - Confronting M-P arguments with the prediction of other theories. |
| Bowen, H.P. (2007) | Conceptual paper | Focus: the empirics of M-P relationship | <ul style="list-style-type: none"> - Statistical issues concerning the empirical estimation of M-P relationship (e.g. (cross-sectional versus panel data; fixed and random effects; omitted firm specific characteristics; model heterogeneity; endogenous regressors; sample selection bias; cross-sectional variation and time-series behaviour). - These problems appear to need resolution but have been largely neglected in the IB literature. - Among these are endogeneity of the M construct in the P relationship and the likelihood that the M-P relationship is heterogeneous across firms. | <ul style="list-style-type: none"> - Developing more specific models of multinationality, and employing techniques which made use of the richness of longitudinal data. - A better delineation of the different modes of multinationality. - Untangling the different sources of performance which are encapsulated in the underlying theoretical explanations. |

Table 4: Summary of previous meta-analysis, literature review, and conceptual articles on the M-P relationships (continued)

| Studies | Types | Sampling and Focus | Findings | Suggestions for future research |
|--|------------------|---------------------------|---|---|
| Contractor, F. (2007) | Conceptual paper | Focus: theoretical debate | <ul style="list-style-type: none"> - A general theory of international expansion and its effect on the performance of firms: three-stage S-curve model. - Using the lens of this theory, it addresses the question why most companies are regional, in the sense that their geographic coverage seems to be far from complete. - Discussion of the lack of congruence in M-P empirical findings: different measurements of P; M; different modes of entry; different sectors; different countries of origin; firms based in emerging economies; other context-dependence and reconciliation through the 3-stage model. - The arguments are that the apparently contradictory results of past studies are but subsets of the three stages of the general theory. | <ul style="list-style-type: none"> - Exploration of micro factors which create the liability of foreignness. - Why is the liability of foreignness small for some companies but persistent in others? - Will companies in emerging markets face greater costs of internationalization because of cultural and geographic distance from major markets, and because of the smaller scale of home country markets? - What determines the inflexion points between the three stages of international expansion? - Why do some companies over-internationalize? Is it conscious? Is there hysteresis? - How many companies are conscious of an optimal DOI as a management or strategy issue? - Limits to internationalization, in terms of dissection of administration and coordination costs. - More studies on the international path of service-sector companies based in emerging and smaller nations. - Longitudinal studies. - Useful empirical work on the M-P linkage in future research requires prior analysis in specific empirical settings. |
| Verbeke, A., Li, L. & Goerzen, A. (2009) | Conceptual paper | Focus: theoretical debate | <ul style="list-style-type: none"> - Past empirical work on M-P relationship is flawed from a conceptual perspective since there is no valid theoretical rationale that would predict a generalizable M-P relationship. - Revisit M-P relationship: three key parameters underlying the substance of the M concept: variety of strategic motivations for FDI, environmental complexity and organizational complexity. | |

Table 4: Summary of previous meta-analysis, literature review, and conceptual articles on the M-P relationships (continued)

| Studies | Types | Sampling and Focus | Findings | Suggestions for future research |
|----------------------------------|-------------------|---|---|---|
| Verbeke, A. & Brugman, P. (2009) | Conceptual paper | 24 most-cited papers of MNEs and SMEs, and 8 papers of S-shaped curves. Focus: theoretical debate | <ul style="list-style-type: none"> - Adopt an internalization theory perspective to raise cautions against assuming too quickly the S-curve model as a generalized M-P relationship. - Firm-level performance depends primarily on the characteristics of the companies' firm-specific advantages (FSAs), rather than on the degree of M. - Propose triple testing the quality of M-P studies: - Test 1: M of a) value chain activities; b) degree of internationalization (DOI) versus diversification; c) related and unrelated diversification. - Test 2: P of a) strategic investment motives; b) Appropriateness of P measures; c) dynamic aspects. - Test 3: M-P linkages of a) use of cross-sectional versus longitudinal data; b) testing P-M relationship c) endogeneity. | <ul style="list-style-type: none"> - Reverse causality and endogeneity: the most critical challenges in M-P research. - FSAs determine the firm's domestic and international success, with the environment acting as a constraining or facilitating force. - A case-based M-P research. - Improve research design with careful operationalization of the concepts and measurements of M, P, and M-P relationship. - Business history case and theory are important for well-grounded propositions instead of long and speculative list of possible costs and benefits of M which are not tested directly but are merely enumerated to support allegedly observed statistical curves. |
| Hult, G.T. (2011) | Commentary in GSI | Focus: comments on Hennart (2011) and Wiersema & Bowen (2011) with strategic focus on M-P | <ul style="list-style-type: none"> - Review of Hennart (2011): Assessing the M-P literature: agree with Hennart's view that deeper theoretical guidance when studying M-P relationship is warranted. Firms do not achieve P simply because of M. Firms achieve performance because they were able to convert the positive aspects of M into something valuable that, in turn, affects P. - Review of Wiersema and Bowen (2011): The puzzle remains. The paper examines international diversification using data on the pattern and evolution of exports and imports by US companies and their foreign subsidiaries: incremental contributions in terms of newness on the empirical literature. A different perspective on the M-P literature, but does not reach any conclusive findings, nor clarify any significant aspect of the relationship. | <ul style="list-style-type: none"> - Theoretically, M has no effect on P without being converted, via action and/or behaviour, into something of value first. The direct link (if found significant), in essence, is a leap of faith that conversion into value took place somewhere along the M to P value chain. |
